Attention: Mr. William J. Andrews

Dear Mr. Andrews:

Re: FortisBC Inc. (FBC)
Project No. 1599231
Annual Review for 2022 Rates (Application)
Response to the B.C. Sustainable Energy Association (BCSEA) Information
Request (IR) No. 1

On August 6, 2021, FBC filed the Application referenced above. In accordance with the regulatory timetable established in British Columbia Utilities Commission Order G-226-21 for the review of the Application, FBCI respectfully submits the attached response to BCSEA IR No. 1.

If further information is required, please contact the undersigned.

Sincerely,

FORTISBC INC.

FortisBC Inc. (FBC or the Company) Annual Review for 2022 Rates (Application)	Submission Date: October 5, 2021
Response to British Columbia Sustainable Energy Association (BCSEA) Information Request (IR) No. 1	Page 1

1.0 Topic: COVID-19 Pandemic Impact on DSM

**Reference: FBC Annual Review for 2020 and 2021 Rates, Exhibit B-5, FEI
Response to BCSEA IR 1.1,
https://www.bcuc.com/Documents/Proceedings/2020/DOC_59341_B-5-FBC-IR1-Response-to-BCSEA.pdf**

In the FBC Annual Review for 2020 and 2021 Rates, BCSEA asked about the impact of the COVID-19 pandemic on FBC's DSM spending and energy savings in 2020 and 2021. FBC provided the following informative response dated October 1, 2020:

"While FBC's DSM spending and energy savings YTD are tracking at approximately 80 percent of planned, FBC expects that the enhanced measures described below will help FBC achieve 90 percent of planned DSM spending in 2020. As discussed in the response to BCSEA IR1 3.2, the COVID-19 pandemic is not the primary reason that energy savings in 2020 will be below plan. FBC will be undertaking best efforts to achieve its approved plan in 2021, but at this time, it is unknown what impact the pandemic may have.

FBC has made adjustments to all of its DSM program areas to adapt to the pandemic and has kept most DSM programs in the market for customers. During the initial stages of the pandemic, FBC put some activities requiring an onsite presence on hold, including, in particular, the Energy Conservation Assistance Program and Rental Apartment Efficiency Program. Where possible, virtual site visits replaced on-site visits. During the first few months of the pandemic, FBC also paused active marketing campaigns for energy-efficient equipment rebates and focused instead on energy saving tips for customers.

To help meet approved DSM expenditure and energy savings levels, FortisBC is supporting the BC Restart Plan, collaborating with program partners BC Hydro and CleanBC, and enhancing incentives to financially support all customers. In the Residential Program Area, FBC is launching a time-limited, pre-qualification period for enhanced heating system incentives from October 1 to December 31, 2020, with the opportunity for equipment installation by March 31, 2021.

To support the construction of high performance homes in an economic downturn, the New Home Program enhanced incentives will remain in the market through 2021. In the Commercial and Industrial program areas, FBC is supporting customers by offering increased incentives through 2021, and modifying the payment structure to support capital project studies and project completion."

1.1 Please provide an update on the impact of the COVID-19 Pandemic on FBC's DSM spending and energy savings for 2021 and 2021.

FortisBC Inc. (FBC or the Company) Annual Review for 2022 Rates (Application)	Submission Date: October 5, 2021
Response to British Columbia Sustainable Energy Association (BCSEA) Information Request (IR) No. 1	Page 2

1 **Response:**

2 FBC assumes that the question is referring to the years 2021 and 2022.

3 Program participation has been minimally impacted by the COVID-19 pandemic with the
4 exception of programs that require in-home installation (i.e., the Energy Conservation Assistance
5 Program and the Rental Apartment Efficiency Program). Those programs that require in-home
6 installation have experienced lower than planned participation due to lower customer demand
7 and additional COVID-19 safety protocols for contractors and implementers. There are no further
8 incentive enhancements currently planned for the remainder of 2021 and 2022.

9 Please also refer to the response to BCSEA IR1 3.1.

10

3.0 Topic: **DSM Savings**

Reference: **FBC Annual Review for 2020 and 2021 Rates, Exhibit B-5, FEI Response to BCSEA IR 3.2,**
https://www.b cuc.com/Documents/Proceedings/2020/DOC_59341_B-5-FBC-IR1-Response-to-BCSEA.pdf

3.1 Please provide FBC's DSM current spending and energy savings figures (actual, projected, planned or forecast as the case may be) for 2019, 2020, 2021, and 2022 broken down by program area. Please explain the reasons for any significant variances from the approved 2019 DSM plan.

Response:

Please refer to Attachments 3.1a and 3.1b for FBC's 2019 and 2020 DSM Annual Reports, which provide the actual 2019 and 2020 DSM spending, energy savings, and explanations for variances.

The 2021 DSM spending and energy savings figures (forecast and planned) for each program area are listed in Table 1 and Table 2 below, respectively. The 2022 Plan is unchanged at this time.

Table 1: 2021 Forecast and Planned DSM Spending by Program Area

Program Area	2021 Forecast (\$000s)	2021 Plan ¹ (\$000s)
Residential	2,487	2,519
Low Income	755	954
Commercial	3,127	3,277
Industrial ²	2,819	2,087
Education & Outreach	676	595
Supporting Initiatives	1,152	1,373
Portfolio	925	1,033
Demand Response	255	451
Total	12,195	12,300

Note:

¹ Includes carry-over from 2019 and 2020 DSM Plan years.

² The industrial program area is expected to exceed plan expenditures due to several large cannabis and forestry energy efficiency projects that were expected to complete in 2020 being delayed and completing in 2021.

Response to British Columbia Sustainable Energy Association (BCSEA) Information Request (IR) No. 1	Page 6

4.0 Topic: Electric Vehicle Charging

Reference: Exhibit B-2, 6.3.4 Clean Growth Initiative – Electric Vehicle (EV) Charging Stations, pdf p.53; FBC Annual Review for 2020 and 2021 Rates, Exhibit B-5, FEI Response to BCSEA IR 4.1, https://www.bcuc.com/Documents/Proceedings/2020/DOC_59341_B-5-FBC-IR1-Response-to-BCSEA.pdf

Regarding the cost of service associated with EV charging stations, FBC states in the Application:

“The cost of service associated with EV charging stations is subject to flow-through treatment, contingent upon approval by the BCUC for inclusion of EV charging stations in rate base.¹⁶ FBC’s application for rates for EV charging stations was adjourned in 2018; however, on July 10, 2020 the BCUC issued Order G-183-20 re-starting the review process and on July 14, 2021, the BCUC issued Order G-215-21 finding that

FBC’s EV direct current fast charging (DCFC) stations are prescribed undertakings under section 5 of the GGRR and approving FBC to include the assets in FBC’s rate base. However, the BCUC did not provide determinations on certain related approvals sought by FBC, including approval of a straight-line 10 percent depreciation rate for FBC’s EV DCFC stations and approval to include related revenues and expenses associated with the EV DCFC stations in FBC’s regulated accounts; as such, the revenue requirement impacts of the decision are not clear at this time. FBC will provide an Evidentiary Update if required once FBC has clarity on these matters.

¹⁶ Costs related to EV charging stations are held outside of rate base pending BCUC approval, pursuant to Order G-9-18.”

In the FBC Annual Review for 2020 and 2021 Rates, FBC stated:

“Pursuant to Order G-9-18, until the BCUC directs otherwise, the associated revenues and costs associated with EV DCFC stations are not

included in the revenue requirements or regulated results. Therefore, neither the revenues nor the costs (O&M or capital) associated with the EV charging stations are accounted for in the Flow-through deferral account at this time.” [Exhibit B-5, BCSEA IR 4.1, underline added]

4.1 Please clarify how revenue from FBC’s EV charging stations is currently treated. Are both costs and revenues tracked separately and excluded from the Flow-through deferral account?

FortisBC Inc. (FBC or the Company) Annual Review for 2022 Rates (Application)	Submission Date: October 5, 2021
Response to British Columbia Sustainable Energy Association (BCSEA) Information Request (IR) No. 1	Page 7

1 **Response:**

2 The revenues and expenses from FBC's DCFC EV charging stations have been accounted for in
3 FBC's non-regulated books, with the exception of embedded power purchase expense as
4 discussed in the response to BCUC IR1 16.1. Please refer to the response to BCSEA IR1 4.2 for
5 the regulatory accounting treatment of FBC's DCFC EV charging stations and to the response to
6 BCUC IR1 16.1 for a discussion of the rate impacts of including FBC's DCFC EV Charging
7 stations in FBC's rates.

8
9
10
11 4.2 In the Application, FBC says that in Order G-215-21 (in the FBC EV DCFC Rates
12 proceeding) the Commission did not provide a determination regarding "approval
13 to include related revenues and expenses associated with the EV DCFC stations
14 in FBC's regulated accounts." Please elaborate on what FBC means by "approval
15 to include related revenues and expenses associated with the EV DCFC stations
16 in FBC's regulated accounts." Is this a remedy that FBC seeks in the EV DCFC
17 Rates proceeding?

18
19 **Response:**

20 Confirmed. Section 4 of the Revised EV Application proposed to record all existing EV stations
21 and all future stations in FBC's regulated rate base and book of accounts (for existing stations,
22 transfer the net book value of the station and net book value of CIAC to FBC's regulated rate
23 base). Furthermore, FBC proposed to forecast costs and revenues associated with EV charging
24 stations in each year during the term of the MRP, including:

- 25 • Forecast the capital expenditures and capital additions entering rate base for EV charging
26 stations that are planned to be constructed in that test year, including the associated
27 depreciation, amortization, earned return, taxes and any other related costs;
- 28 • As part of FBC's Clean Growth Initiatives, O&M related to EV charging will be included as
29 forecast O&M (outside of index-based O&M);
- 30 • Monetization and amortization of carbon credits will be forecast each test year as Other
31 Revenue; and
- 32 • Revenue from EV charging (RS 96) will be forecast as a component of Tariff Revenue in
33 FBC's financial schedules.

34 The costs and revenues associated with the provision of EV charging will be afforded flow-through
35 treatment. This means that any variances between forecast and actual costs associated with the
36 EV charging service will be accounted for in FBC's existing Flow-through deferral account.

FortisBC Inc. (FBC or the Company) Annual Review for 2022 Rates (Application)	Submission Date: October 5, 2021
Response to British Columbia Sustainable Energy Association (BCSEA) Information Request (IR) No. 1	Page 8

In FBC's submission on Adjournment of Proceeding and Interim rates for the EV DCFC Service Revised Application (Revised EV Application), dated August 3, 2021, FBC requested clarification (page 6) of Order G-215-21, specifically for:

- Approval of a straight line 10 percent annual depreciation rate for FBC's EV charging stations; and
- Approval for FBC to include the assets associated with the EV charging stations, and related revenues and expenses, in FBC's regulated accounts, as set out in Section 4 of the Revised EV Application.

FBC notes that on September 1, 2021, the BCUC determined an adjournment of FBC's Revised EV Application is not warranted and a decision addressing the rate approvals sought and any other outstanding items will be issued in due course¹.

4.3 In the FBC EV DCFC Rates proceeding, FBC seeks approval of, among other things, a deferral account to record net revenues that may be realized from the sale of carbon credits arising from the EV Charging Service. What is the status of this request?

4.3.1 What is the current treatment of net revenues from the sale of carbon credits arising from the EV Charging Service?

4.3.2 More broadly, does FBC obtain carbon credits for the electricity it provides to residential and commercial customers who use it to charge EVs? Does FBC obtain carbon credits for the electricity it provides to EV owners through FBC's public fast charging stations? If so, please quantify. If not, why not?

Response:

FBC has proposed to record carbon credit revenue from its EV Charging Stations in Other Revenue and to flow through any variances to customers, as stated in the response to BCSEA IR1 4.2. To date, FBC has not sold any of the carbon credits arising from its EV DCFC stations.

FBC has claimed (but not sold) carbon credits for electricity provided to charge EVs where it reasonably expects that the electricity sold at the meter will be exclusively for transportation by the customer. This includes both public charging stations owned by FBC as well as public stations owned by other entities (metered commercial accounts). FBC does not currently claim credits for non-public EV charging services for either commercial or residential customers. Beginning in 2022, FBC will only be permitted to claim credits for charging stations owned by FBC as detailed

¹ https://www.bcuc.com/Documents/Proceedings/2021/DOC_64011_A-19-BCUC-response-to-submissions.pdf.

FortisBC Inc. (FBC or the Company) Annual Review for 2022 Rates (Application)	Submission Date: October 5, 2021
Response to British Columbia Sustainable Energy Association (BCSEA) Information Request (IR) No. 1	Page 9

- 1 in Information Bulletin RLCF-020. FBC is exploring mechanisms for quantifying and claiming
- 2 credits generated from EV charging at residential buildings that include fewer than five dwelling
- 3 units (including single-family detached housing) as per Information Bulletin RLCF-020.
- 4 To date, FBC has claimed approximately 60 credits in 2019 and approximately 140 credits in 2020
- 5 for FBC-owned public fast charging stations. These credits are still pending validation.

FortisBC Inc. (FBC or the Company) Annual Review for 2022 Rates (Application)	Submission Date: October 5, 2021
Response to British Columbia Sustainable Energy Association (BCSEA) Information Request (IR) No. 1	Page 10

5.0 Topic: FortisBC Corporate and Sustainability Report, Environmental Indicators

Reference: <https://www.fortisbc.com/sustainabilityreport/our-sustainability-performance/protecting-the-environment>; FBC Annual Review for 2020 and 2021 Rates, Exhibit B-5, FBC Response to BCSEA IR 6.1, https://www.bcuc.com/Documents/Proceedings/2020/DOC_59341_B-5-FBC-IR1-Response-to-BCSEA.pdf

FortisBC's online Annual Sustainability Report for 2020 provides the following information regarding Direct and Indirect GHG emissions for FEI and FBC:

"Protecting the environment section"¹

Indicator	2018	2019	2020
Emissions			
Direct greenhouse gas (GHG) emissions (scope 1) ² (figures in tCO ₂ e)	130,000	158,000	133,000
Indirect GHG emissions (scope 2) ³ (figures in tCO ₂ e)	7,200	7,000	6,300

¹ This summary table reports on sustainability data for FortisBC Energy Inc. (FEI) and FortisBC Inc. (FBC) (FEI and FBC collectively, FortisBC) as of December 31, 2020.

² Scope 1 emissions, as defined under the Greenhouse Gas Protocol, are direct emissions from owned or controlled sources. For 2020, this includes externally verified scope 1 GHG emissions as reported to the BC Ministry of Environment of 116,000 tCO₂e and 5,200 tCO₂e for FEI and LNG operations, respectively.

³ Scope 2 emissions, as defined under the Greenhouse Gas Protocol, are indirect emissions from the generation of purchased electricity for own use. Not included is externally verified scope 3 GHG emissions for FBC as reported to the BC Ministry of Environment in 2020 of approximately 38,000 tCO₂e."

In FBC's October 1, 2020 response to BCSEA IR 6.1 in the FBC Annual Review for 2020 and 2021 Rates, FBC stated:

"The figures for Direct and Indirect GHG emissions in the "Protecting Our Environment, Performance Summary" include emissions attributable to FBC (electric) as per Footnote 1. The 2019 Direct GHG emissions for FBC were 6,000 tCO₂e and the 2019 Indirect GHG emissions for FBC were 6,600 tCO₂e.

FortisBC Inc. (FBC or the Company) Annual Review for 2022 Rates (Application)	Submission Date: October 5, 2021
Response to British Columbia Sustainable Energy Association (BCSEA) Information Request (IR) No. 1	Page 11

For 2017 and 2018, the separation of Direct and Indirect GHG emissions attributed to FBC and FEI is problematic as the emissions related to office building use are difficult to separate between entities due to limitations with the dataset. However, at a high level, for Direct GHG emissions,

FBC's contribution to the value is minor (i.e., less than 10 percent) compared to FEI. In contrast, for Indirect GHG emissions, FBC's contribution to the value is significant (i.e., approximately 70 percent) compared to FEI. [underline added]

5.1 What are FBC's Direct and Indirect GHG emissions for 2020?

Response:

In 2020, FBC's Direct and Indirect GHG emissions were approximately 4,000 and 4,300 tCO₂e, respectively.

5.2 Are FBC's Indirect GHG emissions mainly associated with market purchases of electricity?

Response:

FBC's Indirect GHG emissions are mainly associated with market purchases of electricity and the line loss associated with these market purchases.

5.3 In FBC's 2021 Long Term Electricity Resource Plan, recently filed with the BCUC, FBC considers, among other things, a transition to market purchases of 100 percent clean or renewable electricity. If this concept was implemented, would FBC's annual Indirect GHG emissions be expected to decrease?

Response:

If the 2021 Long Term Electricity Resource Plan is approved, and a transition to market purchases of 100 percent clean energy is implemented, then FBC's annual Indirect GHG emissions are expected to decrease.

FortisBC Inc. (FBC or the Company) Annual Review for 2022 Rates (Application)	Submission Date: October 5, 2021
Response to British Columbia Sustainable Energy Association (BCSEA) Information Request (IR) No. 1	Page 12

5.4 FortisBC's Corporate and Sustainability Report reports on Scope 1 (Direct) GHG emissions and Scope 2 (Indirect) GHG emissions. Does FortisBC intend to report on its Scope 3 GHG emissions (all indirect GHG emissions (not included in Scope 2) that occur in the value chain of the reporting company, including both upstream and downstream emissions)? If so, when? If not, why not?

Response:

FortisBC does not currently intend to report out on all Scope 3 GHG emissions (all indirect emissions excluded in Scope 2 that occur in the value chain of the reporting company, including both upstream and downstream emissions). However, FortisBC is currently considering whether to report out on the downstream portion of Scope 3 emissions (natural gas used by customers). FortisBC has committed to provide information on the GHG emissions avoided from the Company's Clean Growth Pathway initiatives as part of the Company's 30BY30 target.

FortisBC Inc. (FBC or the Company) Annual Review for 2022 Rates (Application)	Submission Date: October 5, 2021
Response to British Columbia Sustainable Energy Association (BCSEA) Information Request (IR) No. 1	Page 13

6.0 Topic: Radio-Off Program

Reference: Exhibit B-2, 5.8 Other Recoveries, p.37 (pdf p.46); Schedule 12.1, Unamortized Deferred Charges and Amortization - Non-Rate Base for the Year Ending December 31, 2022, p.85 (pdf p.94)

“5.8 OTHER RECOVERIES

Other Recoveries are primarily comprised of fees earned on the recovery of costs for miscellaneous services, such as street light maintenance charged to municipalities and, beginning in 2020, AMI radio-off meter read fees. There are no variances expected in 2021 Projected compared to 2021 Approved based on amounts recognized to date. The 2022 Forecast is expected to be slightly lower than 2021 Approved due to an expected reduction in AMI radio-off meter read fees from a lower volume of customers choosing the radio-off option. [p.37 (pdf p.46), underline added]

“Advanced Metering Infrastructure Radio-Off Shortfall” is shown in Section 11, Schedule 12.1, Unamortized Deferred Charges and Amortization - Non-Rate Base for the Year Ending December 31, 2022, line 21 [p.85 (pdf p.94)]

FORTISBC INC.		FBC Annual Review for 2022 Rates - August 6, 2021							Section 11
UNAMORTIZED DEFERRED CHARGES AND AMORTIZATION - NON-RATE BASE cont'd									Schedule 12.1
FOR THE YEAR ENDING DECEMBER 31, 2022									
(\$000s)									
Line No.	Particulars	12/31/2021	Opening Bal./ Transfer/Adj.	Gross Additions	Less Taxes	Amortization Expense	12/31/2022	Mid-Year Average	Cross Ref
	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)
21	Advanced Metering Infrastructure Radio-Off Shortfall	49	-	-	-	-	(24)	25	37

6.1 Please provide a table regarding the Radio-Off program showing for 2022, 2021 and previous years (if the data is available) the number of participants, the number of customers eligible for the Radio-Off program, the number of participants as a percentage of the number eligible, the fee revenue, the cost of the radio-off meter reading program, and the surplus/deficit if any.

Response:

Please refer to the response to BCUC IR1 14.1 showing the number of customers choosing radio-off, number of customers eligible, and a percentage representation as of the first week of January for each of the years 2017 to 2021.

Regarding the revenues, costs and net surplus/deficit of the radio-off meter program, FBC provides the following information.

Pursuant to Order G-202-15, the Advanced Metering Infrastructure (AMI) Radio-Off Shortfall deferral account was established to capture the shortfall between actual expenses and the revenue recovered through tariff rates related to radio-off customers. As requested in FBC's 2017 Cost of Service and Rate Design Application and approved by Order G-40-19, FBC continued to

FortisBC Inc. (FBC or the Company) Annual Review for 2022 Rates (Application)	Submission Date: October 5, 2021
Response to British Columbia Sustainable Energy Association (BCSEA) Information Request (IR) No. 1	Page 14

capture the shortfall in the AMI Radio-Off Shortfall deferral account until December 31, 2019. As stated in FBC's 2020-2024 Multi-Year Rate Plan Application and approved by Order G-166-20, beginning January 1, 2020, FBC eliminated the use of the AMI Radio-Off Shortfall deferral account and instead captures the expenses related to radio-off customers in O&M expenses and the associated revenues as Other Recoveries.

The accumulated balance of the deferral account up to December 31, 2019 was \$97 thousand. This amount is being amortized over five years, and this is the amount shown on Line 21 of Schedule 12.1. The table below provides the annual net deficit for each year beginning 2016 and ending 2019, which has been included in the Radio-off Shortfall deferral account.

Table 1: Advanced Metering Infrastructure Radio-Off Net Deficit (Surplus) 2016-2019

Amounts in \$000s	2016	2017	2018	2019
Opening Balance	-	39	88	105
Revenue	(273)	(247)	(230)	(258)
Expense	326	315	253	276
Net Deficit (Surplus)	53	68	23	18
Tax effects	(14)	(18)	(6)	(5)
Amortization	-	-	-	(21)
Ending Balance	39	88	105	97

As outlined in Section 2.5.2.2.2 of the MRP Application and approved by Order G-166-20, effective January 1, 2020, FBC eliminated the use of the Radio-off Shortfall deferral account and instead included the cost of the meter reads in O&M expense, with the fees from radio-off meter reads recognized in Other Recoveries. As a result, the net surplus/deficit is not available for 2020 and onwards since the amount of labour associated with meter reads is no longer being coded on time sheets, because the separate tracking to a deferral account is not required. FBC can confirm that the fees from radio-off meter reads, which are identifiable in Other Recoveries, are \$0.256 million for Actual 2020, \$0.232 million for Approved and Projected 2021, and \$0.225 million for Forecast 2022.

6.2 Please provide an explanation of the "Advanced Metering Infrastructure Radio-Off Shortfall" figures in Schedule 12.1.

Response:

Please refer to the response to BCSEA IR1 6.1.

1. REPORT OVERVIEW

This Demand-Side Management (DSM) Annual Report (the Report) provides highlights of FortisBC Inc.'s (FBC or the Company) DSM programs for the year ended December 31, 2019 and provides a summary of results achieved in 2019. The Report reviews the progress of FBC's DSM programs in meeting the approved 2019-2022 DSM Plan¹ (Plan) by educating and incenting FBC's customers to conserve energy and improve the energy efficiency of their homes, buildings and businesses.

Section 1.1 contains a statement of financial results (Table 1-1); including the Total Resource Cost (TRC) benefit/cost ratio cost-effectiveness test results by Program Area for 2019. Section 1.2 includes summaries of how FBC's DSM programs met the requirements of the British Columbia Demand-Side Measures Regulation (DSM Regulation) enacted under the Utilities Commission Act (UCA). Sections 2 through 9 of the Report provide an overview of DSM program activities in 2019, by Program Area, including program-level comparisons of actual energy savings and costs to Plan.

Consistent with previous DSM annual reports, additional details on 2019 program results, cost-effectiveness test results, as well as historical DSM costs and energy savings are included in Appendix A-1 and Appendix A-2, respectively.

An Evaluation report on Residential Products, including lighting and appliances, is underway but the customer in-store intercepts were not able to be undertaken during the fall retail campaign as planned, and therefore completion of the report for integration into the 2019 DSM Report is delayed. The intercepts are to be rescheduled during the next retail campaign, and the completed report is to be filed in due course.

1.1 PORTFOLIO LEVEL RESULTS

Table 1-1 provides an overview of FBC's 2019 energy savings, expenditures and TRC cost-effectiveness test results for all DSM programs, by Program Area and at the portfolio level. FBC achieved an overall portfolio TRC of 1.9 on DSM expenditures of \$10.1 million, an increase of \$2.9 million over 2018. Electricity savings totalled 25.8 GWh, a decrease of 5.4 GWh compared to 2018. All of FBC's DSM programs passed the TRC test at the program level, although certain measures, e.g. BC Step Code 5 in the New Home program, required the modified TRC to pass.

FBC's 2019 DSM expenditures were \$10.1 million or 92 percent of Plan. The 2019 DSM energy savings were 25.8 GWh or 79 percent of Plan, primarily due to lower than expected Industrial program participation and resulting impacts to energy savings.

¹ 2019-2022 DSM Plan expenditures were accepted by the Commission pursuant to Order G-47-19.

In accordance with past practice, additional detail and results for the TRC, Utility Cost Test (UCT), and the Ratepayer Impact Measure (RIM) cost effectiveness tests, and Levelized Costs are provided for the overall portfolio and each Program Area in Appendix A-1.

Table 1-1: DSM Portfolio Summary Results for 2019

Program Area (Sector)	2019 Plan Savings (kWh)	Actual Savings YE (kWh)	2019 Plan (\$000s)	Actual YE (\$000s)	Benefit/Cost TRC
Residential	6,036,698	6,501,343	\$ 2,086	\$ 2,189	2.7
Low Income	1,212,666	1,348,981	\$ 843	\$ 937	1.6
Commercial	15,541,892	14,962,886	\$ 3,178	\$ 3,385	2.1
Industrial	10,036,698	2,977,930	\$ 1,762	\$ 1,096	1.7
Education and Outreach			\$ 566	\$ 575	
Supporting Initiatives			\$ 1,218	\$ 869	
Portfolio			\$ 776	\$ 762	
Demand Response			\$ 477	\$ 264	
Total	32,827,954	25,791,140	\$ 10,906	\$ 10,077	1.9

FBC's DSM expenditures in 2019 were cost-effective according to the methodology set out in section 4 of the DSM Regulation, achieving a portfolio TRC value of 1.9. The TRC for low-income programs includes a 40 percent adder in the benefits, as per DSM Regulation, increasing the deemed cost effectiveness for the Low Income Program Area. The Low Income Program Area achieved a TRC of 1.6, after including the adder.

1.2 MEETING ADEQUACY REQUIREMENTS OF THE DEMAND-SIDE MEASURES REGULATION

FBC notes the Plan complies with the adequacy requirements of the DSM Regulation, including the most recent amendments that came into effect on March 24, 2017. The DSM Regulation adequacy requirements are as follows:

A public utility's plan portfolio is adequate for the purposes of Section 44.1 (8) c of the Act only if the plan portfolio includes all the following:

- a) a demand-side measure intended specifically to either (i) assist residents of low-income households to reduce their energy consumption, or (ii) reduce energy consumption in housing owned or operated by a local government, specified societies and associations, or a governing body of a first nation, if the benefits of the reduction primarily accrue to low-income households occupying the housing, the prescribed housing providers or the first nation governing body if the households in its housing are primarily low-income;
- b) a demand-side measure intended specifically to improve the energy efficiency of rental accommodations;

- c) an education program for students enrolled in schools in the public utility's service area;
- d) an education program for students enrolled in post-secondary institutions in the public utility's service area;
- e) one or more demand-side measures to provide resources as set out in paragraph (e) of the definition of "specified demand-side measure", representing no less than
 - (i) an average of 1% of the public utility's plan portfolio's expenditures per year over the portfolio's period of expenditures; and
- f) one or more demand-side measures intended to result in the adoption by local governments and first nations of a step code or more stringent requirements within a step code.

In later sections of the Report, FBC provides further details on how its 2019 DSM activities meet the adequacy of the DSM Regulation set out above. Section 3 of the Report discusses programs and incentives for low-income customers, including Energy Savings Kits (ESK), the Energy Conservation Assistance Program (ECAP) and the Non-Profit Custom Program. With regards to rental apartment buildings, FBC's offers include the Rental Apartment Efficiency Program (RAP), detailed in Section 2.5. Tenants can also access ECAP and ESK offers available to qualifying rental properties.

In terms of school education programs (Section 6.5), FBC funded a variety of initiatives for K-12 students, including FortisBC Energy Leaders, and also funded post-secondary student engagement initiatives.

FBC provided resources indicated by clause (e) for Codes and Standards (Section 7.5), which are fulfilled through third party funding arrangements. An expenditure of \$120 thousand, of the Plan \$97 thousand, was recorded.

FBC supported step code adoption through its New Home Program (Section 2.3) with progressive rebates to align with the BC Energy Step Code, and by funding Community Energy Specialists to local governments (Section 7.3).

1.3 ADDRESSING BCUC DIRECTIVES

The BCUC Decision and Order G-47-19 on FBC's 2019-2022 DSM Plan filing continues the practice of funding transfers between program areas, as stipulated and furthermore authorizes the Company to rollover unspent Plan amounts to the subsequent fiscal year.

The practice of transferring expenditure amounts within FBC's DSM portfolio applies to the tracking of actual versus approved spending amounts for each of the Program Areas. It acknowledges that the approved expenditure amount is a forecast and that actual spending in

each Program Area will inevitably vary from the forecast to some degree. A Program Area in which annual expenditures are somewhat less than Plan has availability within its approved program expenditure envelope to balance against a Program Area that might spend somewhat more than its approved amount. This balancing or 'transfer' allows FBC to maximize the use of its total approved portfolio expenditure amount while managing the uncertainties and external factors that can impact program development and delivery.

Rollover refers to any approved Program Area expenditure amount that was not spent in a given year (after accounting for funding transfers) and can therefore be spent in the following year. These amounts are 'rolled over' to the next year's annual approved spending limit. The ability to roll funds over from one year to the next also provides flexibility for FBC to manage uncertainties and external factors that can impact program development and delivery – in this case by making unspent expenditure amounts in one year available to benefit customers in the next year.

Order G-47-19 directs FBC "to continue filing DSM annual reports with the BCUC in the manner and form of previous years, but to also include information that clearly identifies all funding transfers that occur between program areas within a year, and the amounts to be rolled over to the following year for each program area". Furthermore, "[Only] In cases where a proposed transfer into or out of an approved program area is greater than twenty five percent of that program area's accepted expenditures for the year in question, prior BCUC approval is required."

The following Table 1-2 shows the 2019 funding transfers between Program Areas and carryover expenditure amounts available by Program Area for 2020. FBC notes that all funding transfers completed in 2019 were within the prescribed 25 percent of Program Area Plan threshold.

The 2019 transfers consisted of moving \$413 thousand out of the Industrial Program Area, which represents 23 percent of its Plan, and into the Residential (\$103 thousand), Low Income (\$94 thousand), Commercial (\$206 thousand) and CEO (\$9 thousand) Program Areas to support 2019 performance in those sectors. The remaining Industrial Program Area budget of \$254 thousand will be carried over into 2020.

The last column of Table 1-2 indicates the carryover amounts available, by program area, in 2020.

Table 1-2: 2019 DSM Funding Transfers and 2020 Carryover Amounts

Program Area (Sector)	2019 Plan (\$000s)	2019 Actual YE (\$000s)	2019 Actual less Plan (\$000s)	2019 Funding Transfers In (Out) (\$000s)	2019 Transfer as percent of Plan	2020 Carryover Amounts (\$000s)
Residential	\$ 2,086	\$ 2,189	103	103	5%	-
Low Income	\$ 843	\$ 937	94	94	11%	-
Commercial	\$ 3,178	\$ 3,385	206	206	6%	-
Industrial	\$ 1,762	\$ 1,096	(667)	(413)	-23%	254
Education and Outreach	\$ 566	\$ 575	9	9	2%	-
Supporting Initiatives	\$ 1,218	\$ 869	(349)	-		349
Portfolio	\$ 776	\$ 762	(14)	-		14
Demand Response	\$ 477	\$ 264	(213)	-		213
Total	\$ 10,906	\$ 10,077	(\$830)	\$ 0		\$ 830

1.4 COLLABORATION & INTEGRATION

FBC continues to collaborate and integrate DSM programming among BC's large energy utilities, as well as with other entities such as governments and industry associations. The Company recognizes that doing so will maximize program efficiency and effectiveness.

FBC, FortisBC Energy Inc. (FEI), and BC Hydro and Power Authority (BC Hydro) (collectively, the BC Utilities) continued to collaborate on various programs and projects through their voluntary Memorandum of Understanding (MOU), the purpose of which is to develop enhanced utility integration in support of government legislation, policy and direction.

As an example, in 2019 BC Hydro shared their Commercial End-Use Survey (CEUS) instrument, which FortisBC adapted to use in its joint gas/electric CEUS that was fielded in early 2020. The CEUS results will be used as key inputs to FortisBC's 2020 Conservation Potential Review updates.

The BC Utilities also continue to experience cost efficiencies from their collaboration efforts, including streamlined application processes for customers, extended program reach and consistent and unified messaging intended to improve energy literacy.

FBC, FEI and the Ministry of Energy, Mines and Petroleum Resources (MEMPR) continued to collaborate in 2019. FBC's collaboration with MEMPR on CleanBC initiatives includes administering incentives and enabling applications for CleanBC rebates through FBC's application processes to provide a streamlined customer experience.

Although collaborative activities are captured in Program Area sections, the tables contained throughout this Annual Report include only expenditure and savings information for FBC's expenditure portfolio.

1.5 *PORTFOLIO SUMMARY*

FBC's DSM portfolio met the goal of cost effectiveness, with a TRC value of 1.9 in 2019. FBC believes that both energy savings accounted for in the portfolio and the resulting TRC are conservative.

In addition to the direct energy benefits accounted for in the TRC, benefits from additional activities, such as CEO and Supporting Initiatives, play an important role in supporting the development and delivery of programs, while helping facilitate market transformation in British Columbia.

2. RESIDENTIAL PROGRAM AREA

2.1 OVERVIEW

The Residential Program Area achieved aggregate electricity savings of 6.5 GWh, a 25 percent increase over 2018, and an overall TRC of 2.7. Approximately \$2.2 million was invested in Residential energy efficiency programs in 2019, compared to \$1.4 million in 2018, and 75 percent of those expenditures were incentives to customers. The energy savings achieved from Residential programs were 107 percent of Plan.

Residential programs address customers' major end-uses in residential detached dwellings, townhomes, mobile homes and rental apartments, and include retrofit and new home applications. Residential programs, in combination with education and outreach activities, play an important role in driving the culture of conservation in British Columbia.

Table 2-1 summarizes the actual expenditures for the Residential Program Area in 2019 compared to Plan, including incentive and non-incentive spending, and annual electric savings.

Table 2-1: 2019 Residential Program Area Results Summary

Program	Savings (kWh)		2019 Plan (\$000s)	Actual Expenditures (\$000s)		
	Plan	Actual YE	Total	Total	Incentive	Non-Incentive
Home Renovation	3,264,410	3,227,312	\$ 1,200	\$ 1,487	\$ 1,403	\$ 83
New Home	340,148	111,976	\$ 184	\$ 90	\$ 72	\$ 18
Lighting	2,283,947	3,141,261	\$ 157	\$ 218	\$ 174	\$ 44
Rental Apartment	148,193	20,793	\$ 54	\$ 33	\$ 4	\$ 28
Labour and expenses			\$ 491	\$ 362		\$ 362
Total	6,036,698	6,501,343	\$ 2,086	\$ 2,189	\$ 1,654	\$ 535

2.2 HOME RENOVATION

The Home Renovation Rebate (HRR) program encourages customers to take a whole home approach to their energy efficiency upgrades by consolidating space heating, water heating and building envelope measures into an overarching program. This program is a collaboration between the BC Utilities, and MEMPR CleanBC Better Homes program.

Notable highlights for the year include:

- FBC and program partners continue to support the evolving Home Performance industry through trades outreach, training, development of program registered contractor directories, site visits for program compliance quality installation and contractor accreditation initiatives. These activities provide value to customers through increased performance and longevity of installed equipment and improved comfort of their homes. Funding for these activities are outlined in Enabling Activities, Trade Ally Network.

- The optional Program Registered Contractor (PRC) initiative was launched for heat pump contractors, in partnership with BC Hydro. Contractors opting to participate in the PRC program were required to take part in best practices training and pass three site visits prior to receiving their Program Registered Contractor designation.
- A new measure introduced in 2019 was communicating or “smart” thermostats.
- Over 360 customers received heat pump rebates in 2019, an increase of 25 percent over 2018. Program improvements implemented in late 2018 streamlined the customer application process resulting in increased participation in 2019.
- Heat Pump Water Heater activity levels continue to gain traction with 47 participants installing such units, an 88 percent increase over 2018.
- Bathroom fan rebates, captured under the HRR program, were offered through the spring and fall retail campaigns.

2.3 NEW HOME

FBC, in collaboration with FEI, transitioned its whole home incentives from the ENERGY STAR standard to align with the five tiers of the BC Energy Step Code for Part 9 Buildings, as directed in the 2017 Amendment to the DSM Regulation. The Amendment supports the BC Utilities’ ability to provide incentives for builders who adopt and comply with the Energy Step Code in municipalities across BC.

The New Home Program continued to see participation increase in 2019 with a majority of projects registering at the top tiers of the BC Energy Step Code. FBC continues to collaborate with FEI, BC Hydro, MEMPR and BC Housing to provide education to builders and energy advisors, and support policy regarding High Performance Homes in BC.

2.4 RESIDENTIAL LIGHTING

As LED lights are moving towards market maturation it becomes increasingly difficult to maintain historical program participation levels. Two successful retail campaigns offering point-of-sale rebates, for lighting and other qualifying retail products, ran in spring and fall.

An initiative to retrofit lighting in Indigenous-owned housing was implemented with Indigenous communities within FBC’s service area. Inventories of existing bulb types and quantities were completed and LED replacements were supplied and shipped for installation by the communities.

The three initiatives combined resulted in program results exceeding planned savings by 38 percent and expenditures by 37 percent.

2.5 RENTAL APARTMENT

There are three components to the Rental Apartment Program (RAP):

1. To provide direct install in-suite energy efficiency measures for occupants (renters) in multi-family rental properties;
2. To provide rental building owners and/or property/management companies with energy assessments recommending building level energy efficiency upgrades, such as common area lighting upgrades; and
3. To provide support in implementing the recommended upgrades and applying for rebates.

The program is offered jointly by FEI and FBC in the shared service territory (SST)² and by FEI outside the SST. Ten buildings in the SST received in-suite installations in 2019, with 3,058 individual measures installed which included LED bulbs, low-flow showerheads and faucet aerators.

2.6 SELECTED HIGHLIGHTS

The Residential Program Area realized 6.5 GWh of energy savings with actual expenditures of \$2.2 million, and achieved a TRC of 2.7. In 2019, the Home Renovation and Lighting programs provided nearly equivalent savings results to the Residential Program area, delivering 49 percent and 48 percent respectively. In contrast, 63 percent of the 2018 energy savings were based on the Lighting program. The shift reflects FBC's efforts to reduce its reliance on lighting measures as that market matures.

FBC's Residential programs enabled customers to upgrade lighting and appliances, and to capture ongoing energy savings. These programs enabled FBC to continue building on relationships with the trades for education and program awareness. The combination of financial incentives, policy support, contractor outreach, and ongoing marketing is instrumental to the success of these programs in generating energy savings and fostering market transformation in the residential sector.

² The Shared Service Territory is the overlapping service territories of FBC and FEI where both natural gas and electricity are supplied.

3. LOW INCOME PROGRAM AREA

3.1 OVERVIEW

FBC worked collaboratively with FEI to deliver programs to Low Income customers, including non-profit housing organizations and charities serving low-income people. In 2019, FBC invested \$937 thousand and achieved 1.3 GWh in energy savings, compared to \$679 thousand and 0.7 GWh in 2018. The 2019 TRC was 1.6.

Table 3-1 summarizes the Plan and actual expenditures for the Low Income Program Area.

Table 3-1: 2019 Low Income Program Results Summary

Program	Savings (kWh)		Plan (\$000s)	Actual Expenditures (\$000s)		
	Plan	Actual YE	Total	Total	Incentive	Non-Incentive
Self Install (ESK)	249,401	527,046	\$ 74	\$ 143	\$ 126	\$ 16
Direct Install (ECAP)	891,148	636,150	\$ 665	\$ 519	\$ 434	\$ 85
Social Housing Support	72,117	185,784	\$ 41	\$ 60	\$ 46	\$ 13
Labour and expenses			\$ 64	\$ 217	\$ -	\$ 217
Program	1,212,666	1,348,981	\$ 843	\$ 937	\$ 606	\$ 331

3.2 SELF INSTALL

The Self Install Program is a program whereby income-qualified participants receive an Energy Savings Kit (ESK) in the mail that includes energy saving measures along with an instruction booklet and directions to access online “how to” videos. All measures are easy-to-install measures that participants install themselves. The ESK offer is a partnership program with FEI.

The Self Install Program achieved 193 percent of Plan expenditures and 211 percent of Plan Savings. The Self-Install Program was promoted and distributed at local food banks and other community events, through on-line digital promotions, bill inserts and Contact Centre referrals. The Company also continued its partnership with the Ministry of Social Development and Social Innovation to promote the ESKs to their clientele.

3.3 DIRECT INSTALL

The Direct Install Program is a program whereby income-qualified participants receive an in-home visit from a program contractor to install basic measures (e.g. LED lighting, high efficiency showerheads, etc.) and provide customized energy efficiency coaching. Additionally some participants also qualify to receive more robust measures such as fridges and insulation. Partners in the Direct Install Program include FEI and BC Hydro.

The Direct Install Program achieved 78 percent of Plan expenditures and 71 percent of Plan Savings. The Direct Install Program was promoted to social housing providers through one-to-one outreach efforts, partner referrals, promotions through food banks, referrals from the Contact Centre and through direct mail to past participants of the ESK program.

3.4 *SOCIAL HOUSING SUPPORT*

The Social Housing Support program provides a straightforward path for qualifying participants to receive a Prescriptive rebate for upgrading to energy efficient equipment. Current rebates are specific to non-profit housing buildings and in the future may include rebates for single-family homes too.

The Support Program is currently targeted to social housing apartment buildings to replace inefficient equipment and systems with high-efficiency solutions. The program currently includes energy studies and implementation support.

The Support Program is a partnership with FEI and BC Hydro and integrates with BC Housing and BC Non-profit Housing Association funding channels.

The program achieved \$60 thousand in expenditures, of which \$46 thousand were prescriptive incentives for qualifying Social Housing Support providers and \$13 thousand for program administration.

3.5 *SELECTED HIGHLIGHTS*

Overall, 2019 results exceeded Plan targets, in terms of both energy savings and investments. An investment of \$937 thousand and achievement of 1.3 million kWh in energy savings represents a 38% growth in investments and a 90% growth in energy savings relative to 2018. These results are attributable to effective marketing, outreach, and partnerships.

4. COMMERCIAL PROGRAM AREA

4.1 OVERVIEW

Commercial DSM programs encourage commercial customers (including institutions and government) to reduce overall consumption of electricity and associated energy costs. The Commercial programs produced aggregate electricity savings of 15 GWh, compared to 23.9 GWh in 2018³, and achieved an overall TRC of 2.0 in 2019. Commercial program expenditures totaled \$3.4 million, approximately the same as in 2018, of which 68 percent was in the form of incentives.

Table 4-1 summarizes Plan and actual expenditures for the Commercial programs, including incentive and non-incentive spending, and annual energy savings achieved.

Table 4-1: 2019 Commercial Program Results Summary

Program	Savings (kWh)		2019 Plan (\$000s)	Actual Expenditures (\$000s)		
	Plan	Actual YE	Total	Total	Incentive	Non-Incentive
Commercial Custom	4,428,000	6,587,964	\$ 980	\$ 1,274	\$ 1,268	\$ 5
Commercial Prescriptive	11,113,892	8,374,923	\$ 1,371	\$ 1,505	\$ 1,461	\$ 45
Labour and expenses	-	-	\$ 828	\$ 606	\$ -	\$ 606
Total	15,541,892	14,962,886	\$ 3,178	\$ 3,385	\$ 2,729	\$ 656

The Commercial sector recorded savings of 15 GWh, or 99 percent of Plan, of which 56 percent were realized through the Prescriptive Program, primarily commercial LED lighting rebates. The remaining savings came through the Commercial Custom Program, which included custom retrofit rebates on HVAC and motor projects, new construction rebates for high performance buildings and a pilot recommissioning offer.

4.2 PRESCRIPTIVE PROGRAM

This program provides rebates for the installation of high efficiency electric equipment in various applications including lighting, space heating, commercial kitchen, commercial laundry and refrigeration equipment. Simple rebates are provided for equipment that meet specific performance standards, as opposed to the Custom program, which requires more detailed analysis of measures as installed. The program makes use of midstream and downstream rebate delivery approaches, as warranted by the particularities of each appliance type and the market it is intended to serve.

³ 2018 experienced a one-time surge of activity, by several large institutional customers, replacing conventional fluorescent tubes with linear LEDs at multiple facilities.

4.3 CUSTOM PROGRAM

FBC and FEI provide incentives to encourage participants to pursue a performance based approach to achieving electricity savings in new and existing buildings. The program encourages detailed analysis of integrated energy saving measures to help identify all technically feasible and cost effective energy savings, and then follows up by providing support for the implementation of those measures. For new buildings, FBC and FEI offered custom program pathways for both support both BC Energy Step Code-aligned buildings and non-aligned buildings.

FEI and FBC launched a pilot recommissioning offer in the FBC services territory to 13 participants. The results of the pilot will be used to inform the planned successor FEI, FBC and BC Hydro recommissioning offer.

4.4 SELECTED HIGHLIGHTS

Commercial Energy Efficiency Program Area activity in 2019 resulted in 15 GWh/year of electricity savings. These programs enabled commercial and institutional customers to conduct both simple and comprehensive energy efficiency upgrades at their buildings.

FBC saw higher than anticipated participation in its custom program offers for high performance new construction, particularly in the health care and education sectors. FBC also completed the measurement and verification to release the final incentive payment for the City of Kelowna LED streetlight project, which accounted for significant portfolio electricity savings and incentive expenditures.

5. INDUSTRIAL PROGRAM AREA

5.1 OVERVIEW

The Industrial DSM programs continued to encourage industrial customers to consume electricity more efficiently. The Industrial programs achieved an overall TRC of 1.7, with electricity savings of 3.0 GWh, double the 2018 savings of 1.6 GWh. Actual Industrial expenditures in 2019 totalled \$1.1 million, compared to \$0.4 million in 2018, of which 83 percent was incentives.

Table 5-1 summarizes the Plan and actual expenditures for the Industrial Program Area in 2019, including incentive and non-incentive spending, and annual electricity savings.

Table 5-1: 2019 Industrial Program Results Summary

Program	Savings (kWh)		Plan (\$000s)	Actual Expenditures (\$000s)		
	Plan	Actual YE	Total	Total	Incentive	Non-Incentive
Industrial Custom	8,226,000	1,867,847	\$ 1,288	\$ 640	\$ 581	\$ 59
Industrial Prescriptive	1,810,698	1,110,083	\$ 290	\$ 282	\$ 276	\$ 6
Labour and expenses			\$ 185	\$ 174	\$ -	\$ 174
Total	10,036,698	2,977,930	\$ 1,762	\$ 1,096	\$ 857	\$ 239

The Industrial Program Area is characterized by large intermittent projects that generally occur less frequently and take much longer to complete, so the realization of energy savings may shift to following year(s). In 2019, much of the program activity concerned investigating and encouraging efficient electric usage in new cannabis production facilities, while supporting existing industrial customers.

The Industrial Program Area saw lower than anticipated participation from cannabis cultivators, owing to fewer new facilities connected. The Industrial Program Area also saw lower than anticipated participation from the wood products industry, due a market decline. Together, this resulted in energy savings, and commensurate incentive expenditures, much lower than Plan. Program administrative costs are largely fixed, and FBC incurred higher costs (than Plan) for additional customer facility assessment studies that were undertaken. These study costs are anticipated to yield future energy savings projects.

5.2 PRESCRIPTIVE PROGRAM

This program provides rebates for the installation of high efficiency electric equipment in various applications including lighting, space heating, irrigation, variable speed drives and certain compressed air equipment. Simple rebates are provided for equipment that meet specific performance standards, as opposed to the Custom program, which requires more detailed analysis of measures as installed. The program makes use of midstream and downstream

1 rebate delivery approaches, as warranted by the particularities of each appliance type and the
2 market it is intended to serve.

3 **5.3 CUSTOM PROGRAM**

4 This program provides incentives to encourage participants in pursuing a performance based
5 approach to achieving electricity savings in new and existing industrial facilities. The program
6 encourages detailed analysis of integrated energy saving measures to help identify technically
7 feasible and cost effective energy savings, and then follows up by providing support for the
8 implementation of those measures.

9 **5.4 SELECTED HIGHLIGHTS**

10 Industrial Energy Efficiency Program Area activity in 2019 resulted in 3.0 GWh/year of electricity
11 savings. These programs enabled industrial customers to conduct both simple and
12 comprehensive energy efficiency upgrades at their buildings.

13 While the Industrial Energy Efficiency Program Area saw higher participation than previous
14 years, it did not meet the Plan expenditures and savings mostly owing to low investment in the
15 wood products sector and significantly lower than anticipated grid connections from cannabis
16 cultivation customers. However, for those cannabis cultivation customers that did connect to
17 FBC, significant opportunities were pursued in the Custom Program with respect to LED
18 agricultural lighting and energy efficient dehumidification technologies.

6. CONSERVATION EDUCATION AND OUTREACH

6.1 OVERVIEW

The Conservation Education and Outreach (CEO) Program Area continues to support the DSM Portfolio goals of energy conservation in a variety of ways. In order to foster a culture of conservation, several initiatives and campaigns were undertaken in 2019, providing information about behaviour change and customer attitudes on efficiency. Educating all types of customers and students who are future customers remains a priority and FBC is continuing to ensure steps are taken to make the information provided relevant and timely.

FBC continued its collaboration with FEI in 2019 to maximize efficiencies across both utilities. Costs continue to be shared on school, residential and commercial outreach as applicable.

Table 6-1 summarizes the Plan and actual expenditures for CEO in 2019.

Table 6-1: 2019 Conservation and Outreach Results Summary

Program	Plan (\$000s)	Actual (\$000s)
Residential Education Program	\$ 217	\$ 223
Residential Customer Engagement Tool	\$ 281	\$ 75
Commercial Education Program	\$ 21	\$ 178
School Education Program	\$ 46	\$ 100
Total	\$ 566	\$ 575

6.2 RESIDENTIAL EDUCATION

CEO continued to provide information to customers and the public on electric conservation and energy literacy and sought out new opportunities to reach customers. Community outreach continued to provide information to customers and the public on electric conservation and energy literacy and sought out new opportunities such as rebate open houses, to reach customers.

FortisBC (FBC and FEI) continued its successful “We’ve got rebates” general marketing campaign to increase awareness of C&EM’s rebate programs. The Company continued to enhance the municipal landing page to further support municipalities in their efforts to promote FBC and FEI rebates and behaviour change.

6.3 CUSTOMER ENGAGEMENT TOOL

The Residential Customer Engagement Tool expenditure was below Plan due to the launch being delayed to 2020 as a result of challenges with supporting systems integration.

6.4 COMMERCIAL EDUCATION

Expenditures were higher than planned to reflect the investment in the Small Business Outreach program as well as communications to further increase awareness and program participation.

To further support and engage small to medium size businesses, FBC, in collaboration with FEI, provided over 491 basic energy assessments in Kelowna, Penticton and Rossland. Customers received advice on saving energy and learned about rebates on high-efficiency upgrades. Of those, 188 businesses took advantage of a more in-depth assessment, which further quantified areas for energy savings and behaviour opportunities that could result in reduced energy consumption. Customers were provided a detailed report that communicated potential savings, incentives, payback and return on investment as well as customized recommendations for next steps.

6.5 SCHOOL EDUCATION

The online, curriculum-connected Energy Leaders school program moved to its third year in market and expanded to include grade eleven and twelve lessons. Energy Leaders now provides lesson plans for all grades from kindergarten to grade twelve. Additionally the following school programs were continued: Energy is Awesome, an interactive presentation focused on energy conservation and safety; and BC Lions Energy Champions program.

Support for the University of British Columbia Okanagan (UBCO) Smart Energy Research Chair continued in partnership with FEI. This work is expected to identify smart solutions around energy conservation, climate change mitigation, demand side management, the development of net-zero communities and provide recommendations and define long-term implementation strategies for smart energy choices. In collaboration with FEI, FBC continued to support behaviour education campaigns delivered by energy specialists in their respective organizations, including post-secondary.

6.6 HIGHLIGHTS

The FBC Commercial, Residential and School Education Programs are not incentive-based programs; thus FBC does not attribute direct savings to them. CEO costs are included at the Portfolio level and incorporated into the overall DSM Portfolio cost-effectiveness results.

Research and evaluation was conducted by an external consultant that provided recommendations regarding whether energy savings should be claimed for any of FortisBC's CEO initiatives. It was determined the CEO Program Area currently does not have any programs or initiatives where electric savings could be claimed. However, FBC will continue to explore behavioural change opportunities that may result in energy savings in the Residential and Commercial sectors.

7. SUPPORTING INITIATIVES

7.1 OVERVIEW

Supporting Initiatives support the goals of conservation and energy management in a variety of ways, from co-funding energy specialist positions, to promoting energy conservation at community events.

Supporting Initiative activities are not incentive-based programs, therefore FBC has not attributed any direct savings to them. Supporting Initiatives costs are included at the portfolio level and incorporated into the overall portfolio cost-effectiveness results. Non-Program Area specific costs, such as telephone and tracking system upgrades, are also reported herein.

Plan expenditures for 2019 were \$1.2 million and actual spending was \$0.9 million. Expenditures on Supporting Initiatives were 28 percent below Plan primarily due to partial year funding of Community Energy Specialist funding, and delay in launching the Reporting Tool.

Table 7-1: 2019 Supporting Initiatives Results Summary

Program	Plan (\$000s)	Actual (\$000s)		
		Total	Incentive	Non-Incentive
Commercial Energy Specialist	\$ 60	\$ 90	\$ 90	\$ -
Community Energy Specialist	\$ 150	\$ 45	\$ 45	\$ -
Trade Ally Network	\$ 152	\$ 102	\$ -	\$ 102
Codes and Standards	\$ 97	\$ 120	\$ -	\$ 120
Reporting Tool & Customer Portal	\$ 466	\$ 302	\$ -	\$ 302
Labour and expenses	\$ 293	\$ 210	\$ -	\$ 210
Total	\$ 1,218	\$ 869	\$ 135	\$ 734

7.2 COMMERCIAL ENERGY SPECIALIST PROGRAM

The Commercial Energy Specialist Program is a joint initiative between FBC and FEI that co-funds Energy Specialist positions in large commercial organizations, including institutional and local government customers. FBC provides up to \$30,000 per year in an annual contract, with a matching amount provided by FEI.

A Commercial Energy Specialist's key priority is to identify and implement opportunities for their organization to participate in FBC and FEI's DSM programs, while also identifying and implementing non-program specific opportunities to use electricity and natural gas more efficiently. There were three participants in this program in 2019. FBC considers this an energy management program, and hence a specified demand-side measure, as defined in the DSM Regulation.

7.3 COMMUNITY ENERGY SPECIALIST PROGRAM

This program funds Community Energy Specialist positions in local municipal governments and regional districts to facilitate energy efficiency planning activities. These include the coordination of the development of community energy plans; the development and promotion of community-level energy related policy; marketing initiatives to promote conservation and efficiency at the community level; and energy efficient design practices and organizational policies such as adopting advanced energy efficiency standards for the entities' own buildings.

There were three participants in this program in 2019. All participants had their Community Energy Specialists in place for only part of the year; hence, the 2019 Plan expenditures were not fully realized.

7.4 TRADE ALLY NETWORK

The Trade Ally Network (TAN) develops and manages a contractor network to promote DSM programs and energy-efficiency messaging. FBC identifies trade allies as equipment manufacturers, service contractors, and distributors and recognizes the influence these industry groups have with the end-use Residential and Commercial customers who make energy-efficiency decisions. This program also supports funding energy efficiency training as outlined in the DSM regulation. Enabling Activities are critical initiatives that support and supplement DSM program development and delivery.

FBC supported and provided education and co-op funding to TAN members to assist them with promoting the installation of high-efficiency appliances and C&EM rebates to their customers. Development work was undertaken in 2019 to expand the Trade Ally Network to include commercial point of sale partners, previously known as Commercial Partners.

7.5 CODES AND STANDARDS

The FBC codes and standards budget funded a number of Canadian Standards Association (CSA) projects:

- Development of an express document for express standard EXP10: Specifications for Testing and Rating Residential Split System Air-to-Water Heat Pump Systems Intended for Domestic Hot Water Service.
- Development of a whitepaper for heat recovery ventilator and energy recovery ventilation.
- Development of an express document for residential multi head units.

FBC also joined several CSA committees to guide and contribute to the development of codes and standards:

- Technical Committee on Building Energy Systems (C424)

- Steering Committee on Energy Efficiency & Renewables (SCOPEER)
- CSA Communities

FBC plans to participate in these projects and committees in 2020.

7.6 REPORTING TOOL & CUSTOMER APPLICATION PORTAL

The launch of the reporting tool and customer application portal was delayed to 2020, causing a portion of the costs of the project to not be realized in 2019.

The scope of the project increased as further program enhancements and integrations with other FortisBC applications were added to the implementation. These enhancements are anticipated to further benefit customers by seamless integration i.e. single sign-on, with other FortisBC technical solutions. These integrations allowed further customer facing enhancements to the system and to the DSM programs that will rely on the tool, resulting in an increase in the scope of the implementation. FBC took advantage of an opportunity to reduce overall licensing costs by advancing payment for licensing fees from future years into 2019.

8. PORTFOLIO EXPENDITURES

8.1 OVERVIEW

Formerly known as Planning & Evaluation (P&E), the actual Portfolio expenditures for 2019 were \$0.8 million, or 98 percent of Plan. Portfolio costs comprise largely of staffing costs and consultant fees for the various studies and pilots undertaken.

Table 8-1: 2019 Portfolio Expenditures Results Summary

Program	Plan (\$000s)	Actual (\$000s)
	Total	Total
Monitoring and Evaluation	\$ 104	\$ 146
DSM Studies	\$ 25	\$ 27
Innovative Technologies	\$ 100	\$ 121
Labour and expenses	\$ 547	\$ 468
Total	\$ 776	\$ 762

The Energy Efficiency and Conservation Advisory Group (EECAG) provides insight and feedback on FortisBC's Portfolio of DSM activities and related issues. This includes DSM program and Portfolio performance, development and design, funding transfers (exceeding the 25 percent threshold), policy and regulations that may impact DSM activities, and other issues and activities as they arise. The EECAG met on November 21, 2019 to discuss the 2019 results to-date and provide input on program barriers and opportunities to expand participation.

8.2 PROGRAM EVALUATION ACTIVITIES

Primary types of Evaluation, Measurement and Verification (EM&V) activities include the following:

- Process evaluations, where surveys and interviews of participants and trade allies are used to assess customer satisfaction and program success;
- Impact evaluations, to measure the achieved energy savings attributable from the program, including free-ridership and spill-over⁴ impacts; and
- Measurement & Verification (M&V) activities, to confirm project specific energy savings associated with energy conservation measures.

The specific Evaluation impact studies funded in 2019 include the Commercial Product Rebate program evaluation (report was filed with 2018 DSM report), and the Retail Products (lights &

⁴ Free-ridership refers to participants who would have participated in the absence of the program and spillover refers to additional reductions in energy consumption or demand that are due to program influence.
Reference: National Renewable Energy Laboratory, <https://www.nrel.gov/docs/fy17osti/68578.pdf>

appliances) program evaluation. The latter study is still in progress, awaiting in-store customer intercept surveys, and will be filed upon completion.

Table 8-2 provides a list of the 2019 DSM Program evaluation and research activities undertaken by the Company in collaboration with utility partners, chiefly FEI and BC Hydro.

Table 8-2: 2019 DSM Program Evaluation and Research Activities

Evaluation Name	Program Area	Type of Evaluation	Evaluation Partners	Evaluation Status
Commercial End Use Study	Enabling Activities	Communications	FortisBC Energy Inc. & FortisBC Inc.	Survey conducted with commercial customers including multi-family residential buildings to collect information about the building, the business(es) occupying the building, the fuel choice for heating, cooling and cooking, the types and ages of the appliances installed, energy-use behaviors, and customer attitudes towards energy issues. To be completed Q2 2020
Retail Program Evaluation	Residential	Process & Impact	FortisBC Energy Inc. & FortisBC Inc.	Customer survey, literature review and consumption analysis for the residential retail programs. To be completed Q2 2020
Participant and Building Owner Surveys	Residential / Commercial	Process	FortisBC Energy Inc. & FortisBC Inc.	Surveys conducted with building owner and tenant to assess customer satisfaction, program awareness, and gather feedback for future program design. 2018 results: Completed February 2019 by Cohesium Research 2019 results: To be completed Q1 2020
Furnace Quality Assurance	Low Income	Evaluation Study	FortisBC Energy Inc., FortisBC Inc. & BC Hydro	Ongoing quality assurance to ensure direct install measures are installed according to program policies and procedures.
Ongoing Customer Feedback Survey	Low Income	Process	FortisBC Energy Inc., FortisBC Inc. & BC Hydro	Survey with Direct Install program participants to gather frequent and ongoing feedback on their customer experience, satisfaction with the program and the program evaluators. 2018 results: Completed March 2019 by Sentis Market Research 2019 results: To be completed Q2 2020
Smart Learning Thermostat Pilot	Innovative Technologies	Measurement & Verification	FortisBC Energy Inc. & FortisBC Inc.	Measurement of energy savings, installation and customer acceptance associated with smart learning thermostats. Completed April 2019 by APEX Analytics LLC

8.3 DSM STUDIES

DSM studies undertake key research, e.g. end-use surveys, and support long-term planning such as Conservation Potential Reviews. The Company's 2019 DSM Studies included:

- Residential cluster analysis, to identify key end-uses associated with monthly load profiles;
- Develop Commercial End-Use Survey (CEUS) instrument, to be fielded in early 2020; and
- Joint gas/electric portfolio review to gauge FortisBC DSM performance and capability to scale up program depth and breadth.

8.4 INNOVATIVE TECHNOLOGIES

Innovative technology funding supports the development of or increased use of a "technology, a system of technologies, or a building or industrial facility design that could achieve significant

1 reductions of energy use or significantly more efficient use of energy”⁵. FBC uses innovative
2 technology funding to support feasibility studies, technology pilots, and field studies to assess
3 the potential for these technologies.

4 In 2019, FBC funded several innovative technology studies including cold climate heat pumps,
5 cannabis production, and electric vehicle service equipment (EVSE). FBC launched a field
6 study to assess the performance of cold climate heat pumps in partnership with Natural
7 Resource Canada, BC Hydro, and MEMPR. Concluding in 2020, this field study will provide
8 valuable data on the performance of cold climate heat pumps in BC to help increase adoption
9 and improve energy savings from heat pumps. Cannabis production could add significant load
10 to FBC’s electric system. FBC is currently studying the potential energy savings for a number of
11 measures that growers could use to produce cannabis more efficiently in partnership with
12 several other Canadian and American utilities. Finally, electric vehicles are another developing
13 sector that will increase load and potentially system peaks. The EVSE feasibility study looked at
14 the opportunities and costs to mitigate negative impacts on peak demand. The following section
15 describes the stand-alone Demand Response pilot program, which is also related to reducing
16 demand and peak loads.

17

⁵ Technology innovation program defined in the Demand-Side Measures Regulation 326/2008 (amended Mar. 24, 2017).

9. DEMAND RESPONSE

9.1 OVERVIEW

The Kelowna Demand Response Pilot program for Commercial and Industrial (C&I) customers was launched in the summer of 2019. Its primary purpose was to test the viability of voluntary demand response from a subset of FBC's top 50 C&I customers in the Kelowna area.

Table 9-1: 2019 Demand Response Results Summary

Program	Plan (\$000s)	Actual (\$000s)
	Total	Total
Demand Response	\$ 477	\$ 264
Total	\$ 477	\$ 264

The \$477 thousand Plan expenditure was based on an estimate from the consultants who authored the Kelowna Demand Response Assessment Report⁶. The \$264 thousand expenditure reflects the actual cost incurred based on cost savings achieved through the procurement process, and the mid-summer start.

9.2 KELOWNA AREA DEMAND RESPONSE PILOT

The recruitment phase revealed various barriers to participation including the program novelty i.e. temporary load curtailment, compared to FBC's traditional energy savings programs.

The program Implementer utilized FBC's AMI platform for this pilot. The AMI meters' Zigbee radio signal was transferred via cellular modem to the Implementer software platform; providing participants with near real-time graphical load profile, and subsequently utilized AMI data to verify event response levels and participant incentives.

The summer pilot results were limited by: few participants, a foreshortened 2-month window, relatively mild summer weather and reliance on site personnel to respond. The 2019-20 winter phase ran for the full 4 months starting Nov 1st. By then more participants were in place, including a major Kelowna pump-house and two secondary schools.

⁶ Appendix A-1 of FBC's approved 2019-2022 DSM Expenditure Plan.

APPENDIX A – DETAILED BENEFIT-COST RATIOS

APPENDIX A-1 – DSM PROGRAMS COST AND SAVINGS SUMMARY REPORT FOR 2019

Table A1-1: FBC DSM Summary Report for Year Ended December 31, 2019

Program Area	Annual Electricity Savings (MWh)		Utility Expenditures (\$000s)			Cost Effectiveness Tests (Benefit/Cost Ratio)				Levelized cost (¢/kWh)

Attention: Mr. Patrick Wruck, Commission Secretary

Dear Mr. Wruck:

Re: FortisBC Inc. (FBC) Electricity Demand-Side Management (DSM) – 2020 Annual Report

Attached please find the Electricity DSM Program 2020 Annual Report for FBC (the Annual Report).

Request for Confidentiality of Certain Information

FBC is filing full evaluation reports which were substantially completed in 2020 for the Retail Program (consisting of Residential Lighting and Appliance programs); and the Heat Pump programs provided in Appendix C. FBC requests that the full reports be filed on a confidential basis pursuant to Section 18 of the British Columbia Utilities Commission's Rules of Practice regarding confidential documents adopted by Order G-15-19. The full reports must be kept confidential on the basis that the reports contain customer-specific information that should not be disclosed to the public. In addition, the methodology and processes used in the report are proprietary to the consultants hired by FBC. The publicly available Executive Summary of the evaluations of the Programs are provided in Appendix B.

If further information is required, please contact Sarah Wagner, Senior Regulatory Analyst, at (250) 469-6081.

Sincerely,

FORTISBC INC.

1. REPORT OVERVIEW

This Demand-Side Management (DSM) Annual Report (the Report) provides highlights of FortisBC Inc.'s (FBC or the Company) DSM programs for the year ended December 31, 2020 and provides a summary of results achieved in 2020. The Report reviews the progress of FBC's DSM programs in meeting the approved 2019-2022 DSM Plan¹ (Plan) by educating and incenting FBC's customers to conserve energy and improve the energy efficiency of their homes, buildings and businesses.

Section 1.1 contains a statement of financial results (Table 1-1); including the Total Resource Cost (TRC) benefit/cost ratio cost-effectiveness test results by Program Area for 2020. Section 1.2 sets out how FBC's DSM programs met the requirements of the British Columbia Demand-Side Measures Regulation (DSM Regulation) enacted under the Utilities Commission Act (UCA). Sections 2 through 9 of the Report provide an overview of DSM program activities in 2020 by Program Area, including program-level comparisons of actual energy savings and costs to Plan.

Consistent with previous DSM annual reports, additional details on 2020 program results, cost-effectiveness test results and levelized costs, as well as historical DSM program costs and energy savings are included in Appendix A-1 and Appendix A-2, respectively.

1.1 *PORTFOLIO LEVEL RESULTS*

Table 1-1 provides an overview of FBC's 2020 energy savings, expenditures and TRC cost-effectiveness test results for all DSM programs, by Program Area and at the portfolio level. FBC achieved an overall portfolio TRC of 1.6 on DSM expenditures of \$10.2 million, an increase of \$0.1 million over 2019. Electricity savings totalled 26.2 GWh, an increase of 0.3 GWh compared to 2019. All of FBC's DSM programs passed the TRC test at the program level, although certain measures (e.g. BC Step Code 5 in the New Home program) required the modified TRC (mTRC) to pass.

FBC's actual 2020 DSM expenditures were 96 percent of 2020 Plan and the DSM energy savings were 81 percent of Plan. The savings shortfall was primarily in the Commercial and Industrial portfolios.

¹ 2019-2022 DSM Plan expenditures were accepted by the Commission pursuant to Order G-47-19.

Table 1-1: DSM Portfolio Summary Results for 2020

Program Area (Sector)	2020 Plan Savings (kWh)	Actual Savings (kWh)	2020 Plan (\$000s)	Actual (\$000s)	Benefit/Cost TRC
Residential	5,624,721	7,201,977	\$2,304	\$2,339	2.4
Low Income	1,213,805	795,883	\$ 873	\$ 818	1.3
Commercial	15,466,737	11,149,823	\$3,031	\$2,805	1.4
Industrial	10,006,686	6,794,817	\$1,788	\$1,767	3.7
Education and Outreach	-	-	\$ 497	\$ 566	-
Supporting Initiatives	-	209,000	\$ 838	\$ 818	-
Portfolio	-	-	\$ 913	\$ 911	-
Demand Response	-	-	\$ 324	\$ 135	-
Total	32,311,949	26,151,500	\$ 10,568	\$ 10,159	1.6

FBC's DSM expenditures in 2020 were cost-effective according to the methodology set out in section 4 of the DSM Regulation, achieving a portfolio TRC value of 1.6. The TRC value of 1.3 for Low Income programs includes a 40 percent adder in the benefits, as per DSM Regulation, increasing the deemed cost effectiveness for the Low Income Program Area.

1.2 MEETING ADEQUACY REQUIREMENTS

The 2019-2022 DSM Plan complies with the adequacy requirements of the DSM Regulation, including the most recent amendments that came into effect on March 24, 2017. The DSM Regulation adequacy requirements are as follows:

A public utility's plan portfolio is adequate for the purposes of Section 44.1 (8) c of the Act only if the plan portfolio includes all the following:

- a) a demand-side measure intended specifically to either (i) assist residents of low-income households to reduce their energy consumption, or (ii) reduce energy consumption in housing owned or operated by a local government, specified societies and associations, or a governing body of a first nation, if the benefits of the reduction primarily accrue to low-income households occupying the housing, the prescribed housing providers or the first nation governing body if the households in its housing are primarily low-income;
- b) a demand-side measure intended specifically to improve the energy efficiency of rental accommodations;
- c) an education program for students enrolled in schools in the public utility's service area;
- d) an education program for students enrolled in post-secondary institutions in the public utility's service area;

e) one or more demand-side measures to provide resources as set out in paragraph (e) of the definition of “specified demand-side measure”, representing no less than

(i) an average of 1% of the public utility’s plan portfolio’s expenditures per year over the portfolio’s period of expenditures; and

f) One or more demand-side measures intended to result in the adoption by local governments and first nations of a step code or more stringent requirements within a step code.

In later sections of the Report, FBC provides further details on how its 2020 DSM activities meet these adequacy requirements. Section 3 of the Report discusses programs and incentives for low-income customers, including Energy Savings Kits (ESK), the Energy Conservation Assistance Program (ECAP) and the Non-Profit Custom Program. With regards to rental apartment buildings, FBC’s offers include the Rental Apartment Efficiency Program (RAP), detailed in Section 2.5. Tenants can also access ECAP and ESK offers available to qualifying rental properties.

In terms of school education programs (Section 6.5), FBC funded a variety of initiatives for K-12 students, including FortisBC Energy Leaders, and also funded post-secondary student engagement initiatives. Extensive work was undertaken by FBC to support virtual learning during the COVID-19 pandemic and to translate Energy Leaders lessons into French.

FBC provided resources indicated by clause (e) for Codes and Standards (Section 7.5), which are fulfilled through third party funding arrangements. An expenditure of \$108 thousand, of the Plan \$107 thousand, was recorded.

FBC supported step code adoption through its New Home Program (Section 2.3) and provided progressive rebates to align with the BC Energy Step Code (BCESC). It also provided funding for Community Energy Specialists to support local government policy development, as well as promote BCESC to local builders and developers (Section 7.3).

1.3 FUNDING TRANSFERS AND CARRYOVER

The BCUC Decision and Order G-47-19 on FBC’s 2019-2022 DSM Plan filing continues the practice of funding transfers between program areas and furthermore allows the Company to carry over unspent Plan amounts to the subsequent fiscal year.

The practice of transferring expenditure amounts within FBC’s DSM portfolio applies to the tracking of actual versus approved spending amounts for each of the Program Areas. It acknowledges that the approved expenditure amount is a forecast and that actual spending in each Program Area will inevitably vary from the forecast to some degree. A Program Area in which annual expenditures are somewhat less than Plan has availability within its approved program expenditure envelope to balance against a Program Area that might spend somewhat more than its approved amount. This balancing or ‘transfer’ allows FBC to maximize the use of

its total approved portfolio expenditure amount while managing the uncertainties and external factors that can impact program development and delivery.

Carryover refers to any approved Program Area expenditure amount that was not spent in a given year (after accounting for funding transfers between program areas) and can therefore be carried over to the following year(s) within the approved DSM Plan time frame. These amounts are 'carried over' into the next years' annual approved spending limit. The ability to carry funds over from one year to the next also provides flexibility for FBC to manage uncertainties and external factors that can impact program development and delivery – in this case by making unspent expenditure amounts from the reporting year available to benefit customers in the following Plan years.

Order G-47-19 directs FBC "to continue filing DSM annual reports with the BCUC in the manner and form of previous years, but to also include information that clearly identifies all funding transfers that occur between program areas within a year, and the amounts to be rolled over to the following year for each program area". Furthermore, "[Only] In cases where a proposed transfer into or out of an approved program area is greater than twenty five percent of that program area's accepted expenditures for the year in question, prior BCUC approval is required."

The following Table 1-2 shows the 2020 funding transfers between Program Areas and carryover expenditure amounts available by Program Area for 2021. FBC notes that all funding transfers completed in 2020 were within the prescribed 25 percent of Program Area Plan threshold.

The 2020 transfers consisted of moving a total of \$103 thousand, taken out of the Demand Response (\$82 thousand), Supporting Initiatives (\$20 thousand), and Portfolio (\$1 thousand) Program Areas, and transferred into the Residential (\$35 thousand) and Conservation Education & Outreach (CEO) (\$68 thousand) Program Areas to support 2020 expenditures in those sectors.

A total of \$409 thousand will be carried over into 2021, as shown by Program Area, in the last column of Table 1-2.

Table 1-2: 2020 DSM Funding Transfers and Carryover Amounts

Program Area (Sector)	2020 Plan (\$000s)	Actual (\$000s)	Variance (\$000s)	2020 Funding Transfers In (Out) (\$000s)	Transfer as a Percent of Plan	2020 Carryover (\$000s)
Residential	2,304	2,339	35	35	2%	-
Low Income	873	818	-55	-	-	55
Commercial	3,031	2,805	-225	-	-	225

Supporting Initiatives	1,024	349	-	1,373
Portfolio	1,019	14	-	1,033
Demand Response	130	213	108	452
Total	11,051	830	409	12,290

1.4 COLLABORATION & INTEGRATION

FBC continues to collaborate and integrate DSM programming among BC's large energy utilities, as well as with other entities such as governments and industry associations. The Company recognizes that doing so will maximize program efficiency and effectiveness.

FBC, FortisBC Energy Inc. (FEI), and BC Hydro and Power Authority (BC Hydro) (collectively, the BC Utilities) continued to collaborate on various programs and projects through their voluntary Memorandum of Understanding (MOU), the purpose of which is to develop enhanced utility integration in support of government legislation, policy and direction.

The BC Utilities also continue to experience cost efficiencies from their collaboration efforts, including streamlined application processes for customers, extended program reach and consistent and unified messaging intended to improve energy literacy.

FBC, FEI and the British Columbia Ministry of Energy, Mines and Low Carbon Innovation (EMLI)², continued to collaborate in 2020. FBC's collaboration with EMLI on CleanBC initiatives includes administering incentives and enabling applications for CleanBC rebates through FBC's application processes to provide a streamlined customer experience.

Although collaborative activities are captured in Program Area sections, the tables contained throughout the Report include only expenditure and savings information for FBC's expenditure portfolio.

² Formerly known as the Ministry of Energy, Mines and Petroleum Resources (MEMPR).

1.5 *PORTFOLIO SUMMARY*

FBC's DSM portfolio met the goal of cost effectiveness, with a portfolio level TRC Benefit/Cost ratio of 1.6 in 2020. FBC believes that both energy savings accounted for in the portfolio and the resulting TRC are conservative.

In addition to the direct energy benefits accounted for in the TRC, benefits from additional activities, such as CEO and Supporting Initiatives, play an important role in supporting the development and delivery of programs, while helping facilitate market transformation in British Columbia.

2. RESIDENTIAL PROGRAM AREA

2.1 OVERVIEW

The Residential Program Area achieved aggregate electricity savings of 7.2 GWh, an 11 percent increase over 2019, and an overall TRC of 2.4. Approximately \$2.3 million was invested in Residential energy efficiency programs in 2020, compared to \$2.2 million in 2019, and 71 percent of those expenditures were incentives to customers. The energy savings achieved from Residential programs were 128 percent of Plan.

Residential programs address customers' major end-uses in residential detached dwellings, townhomes, mobile homes, and rental apartments, and include retrofit and new home applications. Residential programs, in combination with education and outreach activities, play an important role in driving the culture of conservation in British Columbia.

Table 2-1 summarizes the actual expenditures for the Residential Program Area in 2020 compared to Plan, including incentive and non-incentive spending, and annual electric savings.

Table 2-1: 2020 Residential Program Area Results Summary

Program	Savings (kWh)		Plan (\$000s)	Actual Expenditures (\$000s)		
	Plan	Actual	Total	Total	Incentive	Non-Incentive
Home Renovation	3,915,701	3,550,849	1,357	1,348	1,275	73
New Home	439,157	250,557	227	215	204	11
Lighting	1,121,669	3,400,571	163	238	158	80
Rental Apartment	148,193	-	54	37	12	25
Labour and expenses	-	-	503	501	-	501
Total	5,624,721	7,201,977	2,304	2,339	1,650	689

2.2 HOME RENOVATION

The Home Renovation Rebate (HRR) program encourages customers to take a whole home approach to their energy efficiency upgrades by consolidating space heating, water heating and building envelope measures into an overarching program. This program is a collaboration between the BC Utilities, and EMLI CleanBC Better Homes program.

Notable highlights for the year include:

- Enhanced rebates, as part of FBC's COVID-19 Recovery Support Plan, were offered for residential customers through the double rebates initiative that is available for installations completed by March 31, 2021. Additionally, expanded in-store and online retailer activities for residential electric rebates began in October and continued through November.

- 333 customers received heat pump rebates in 2020.
- Heat Pump Water Heater availability to consumers continued to be challenging due to a shortage of experienced contractors in the Kelowna area.
- Two point-of-sale retail campaigns were also captured under the home renovation program area. The first, which ran early in the year, focused on weatherization products and water savers. The second campaign, launched late summer, included a comprehensive suite of measures including weatherization, water savers, communicating thermostats and bathroom fans. Lighting measures were also included in this campaign and are described in section 2.4.
- FBC and program partners continue to support the evolving Home Performance industry through trades outreach, training, development of program registered contractor directories, site visits for program compliance quality installation and contractor accreditation initiatives. These activities provide value to customers through increased performance and longevity of installed equipment and improved comfort of their homes. Funding for these activities is outlined in Enabling Activities, s7.4 Trade Ally Network (TAN).
- The optional Program Registered Contractor (PRC) initiative was launched for heat pump contractors, in partnership with BC Hydro. Contractors opting to participate in the PRC program were required to take part in best practices training and pass three site visits prior to receiving their Program Registered Contractor designation. Similarly, a PRC initiative for insulation contractors is scheduled to launch in spring of 2021.

2.3 NEW HOME

FBC's new home incentives align with the five tiers of the BC Energy Step Code for Part 9 Buildings, as directed in the 2017 Amendment to the DSM Regulation. The Amendment supports the BC Utilities' ability to provide incentives for builders who adopt and comply with the Energy Step Code in municipalities across BC.

The New Home Program continued to see participation increase in 2020 with a majority of projects registering at the top tiers of the BC Energy Step Code. FBC continues to collaborate with FEI, BC Hydro, EMLI and BC Housing to provide education to builders and energy advisors, and support policy regarding the construction of High Performance Homes in BC.

As part of FBC's COVID-19 Recovery Support Plan, The New Home program provided enhanced incentives to encourage builders to keep high performance a priority during the economic downturn.

2.4 RESIDENTIAL LIGHTING

Although LED lights continue to move towards market maturation and the onset of the pandemic in early 2020 resulted in the cancellation of the spring campaign, FBC was able to deliver a successful lighting campaign which exceeded planned savings by 203 percent and expenditures by 46 percent. A restructured approach, with an earlier campaign launch in the fall, saw robust participation in of point-of-sale rebates for LED lightbulbs, fixtures and lighting controls.

2.5 RENTAL APARTMENT

There are three components to the Rental Apartment Program (RAP):

1. To provide direct install in-suite energy efficiency measures for occupants (renters) in multi-family rental properties;
2. To provide rental building owners and/or property management companies with energy assessments recommending building level energy efficiency upgrades, such as common area lighting upgrades; and
3. To provide support in implementing the recommended upgrades and applying for rebates.

The program is offered jointly by FEI and FBC in the shared service territory (SST)³ and by FEI outside the SST.

Typically, the program provides direct installations for 8 to 10 participants per year. In 2020 in-suite work was discontinued early on in the year (approximately mid-March) due to the COVID-19 Pandemic. No direct installation of measures took place prior to mid-March 2020 and the restriction remained in effect for all of 2020 therefore the program reported no kWh savings in 2020.

2.6 SELECTED HIGHLIGHTS

The Residential Program Area realized 7.2 GWh of energy savings with actual expenditures of \$2.3 million, and achieved a TRC of 2.4. In 2020, the Home Renovation and Lighting programs provided the majority of energy savings results to the Residential Program area.

FBC's Residential programs enabled customers to upgrade lighting and appliances, and to capture ongoing energy savings. These programs enabled FBC to continue building on relationships with the trades for education and program awareness. The combination of financial incentives, policy support, contractor outreach, and ongoing marketing is instrumental to the success of these programs in generating energy savings and fostering market transformation in the residential sector.

³ The Shared Service Territory is the overlapping service territories of FBC and FEI where both natural gas and electricity are supplied.

3. LOW INCOME PROGRAM AREA

3.1 OVERVIEW

FBC worked collaboratively with FEI to deliver programs to Low Income customers, including non-profit housing organizations and charities serving low-income people. In 2020, FBC invested \$818 thousand, which was less than the \$937 thousand in 2019 due to COVID-19 impacts, and achieved 0.8 GWh in energy savings. The 2020 TRC was 1.3.

Table 3-1 summarizes the Plan and actual expenditures for the Low Income Program Area.

Table 3-1: 2020 Low Income Program Results Summary

Program	Savings (kWh)		Plan (\$000s)	Actual Expenditures (\$000s)		
	Plan	Actual	Total	Total	Incentive	Non-Incentive
Self Install (ESK)	249,401	287,208	74	75	51	23
Direct Install (ECAP)	881,470	223,578	687	343	190	153
Social Housing Support	82,934	285,098	46	286	270	16
Labour and expenses	-	-	65	114	-	114
Total	1,213,805	795,883	873	818	512	306

3.2 SELF INSTALL

The Self Install Program is a program whereby income-qualified participants receive an Energy Savings Kit (ESK) in the mail that includes energy saving measures along with an instruction booklet and directions to access online “how to” videos. All measures are easy-to-install measures that participants install themselves. The Self Install program is a partnership program with FEI.

The Self Install Program achieved 101 percent of Plan expenditures and 115 percent of Plan Savings. The Self-Install Program was promoted through on-line digital promotions, bill inserts and customer contact centre referrals. The Company also continued its partnership with the Ministry of Social Development and Social Innovation to promote the ESKs to their clientele.

3.3 DIRECT INSTALL

The Direct Install Program is a program whereby income-qualified participants receive an in-home visit from a program contractor to install basic measures (e.g. LED lighting, high efficiency showerheads, etc.) and provide customized energy efficiency coaching. Additionally some participants also qualify to receive more robust measures such as fridges and insulation. Partners in the Direct Install Program include FEI and BC Hydro.

The Direct Install Program achieved 50 percent of Plan expenditures and 25 percent of Plan Savings. The Direct Install Program was promoted to Low Income customers through one-to-one outreach efforts, partner referrals, referrals from the customer contact centre, and through direct mail to past participants of the ESK program.

In 2020, the COVID-19 pandemic impeded the Direct Install program from performing installations in customer's homes for approximately six months. During this time development work was undertaken to design safe working protocols with contractors, and to further the energy savings opportunities for manufactured homes.

3.4 SOCIAL HOUSING SUPPORT

This program area currently includes three measures:

- Rebates for energy studies, implementation support, and non-profit housing providers.
- Energy efficiency training for people facing barriers to employment through the REnEW (Residential Energy Efficiency Works) initiative, a collaborative effort with FEI.
- Rebates specifically designed for single-family dwellings in Indigenous communities, which also includes funding for enabling measures.

The Social Housing Support program far surpassed Plan expenditures and savings largely as a result of new rebates that were developed, and well received, for energy efficiency retrofits of homes in Indigenous communities.

3.5 SELECTED HIGHLIGHTS

Overall 2020 was a difficult year to achieve the participation goals of FBC's Low Income programs. While the Self Install program was popular and relatively unhindered by the COVID-19 pandemic, other programs such as Direct Install suffered. The Direct Install program, a program that typically accounts for a large portion of the portfolio savings, was out of market for approximately half the year. Even when the Direct Install program returned to market, some customers were doing their best to minimize contacts for anything they deemed not essential. On a more positive note, FBC and FEI introduced additional rebates in the Social Housing Support program which enabled Indigenous communities to self-manage their own retrofit projects. These rebates were well received and helped to offset the shortfall in the Direct Install program.

4. COMMERCIAL PROGRAM AREA

4.1 OVERVIEW

Commercial DSM programs encourage commercial customers (including institutions and government) to reduce overall consumption of electricity and associated energy costs. The Commercial programs produced aggregate electricity savings of 11.1 GWh, compared to 15.5 GWh in 2019, and achieved an overall TRC of 1.4 in 2020. Commercial program expenditures totaled \$2.8 million, just slightly less than in 2019, of which 73 percent was in the form of incentives.

Table 4-1 summarizes Plan and actual expenditures for the Commercial programs, including incentive and non-incentive spending, and annual energy savings achieved.

Table 4-1: 2020 Commercial Program Results Summary

Program	Savings (kWh)		Plan (\$000s)	Actual Expenditures (\$000s)		
	Plan	Actual	Total	Total	Incentive	Non-Incentive
Commercial Custom	5,346,000	3,554,306	964	618	609	10
Commercial Prescriptive	10,120,737	7,595,517	1,218	1,513	1,449	64
Labour and expenses	-	-	848	674	-	674
Total	15,466,737	11,149,823	3,031	2,805	2,058	748

The Commercial sector recorded savings of 11.1 GWh, or 72 percent of Plan, of which 68 percent were realized through the Prescriptive Program, primarily commercial LED lighting rebates. The remaining savings came through the Commercial Custom Program, which included new construction rebates for high performance buildings and a pilot recommissioning offer.

4.2 CUSTOM PROGRAM

FBC and FEI provide incentives to encourage participants to pursue a performance based approach to achieving electricity savings in new and existing buildings. The program encourages detailed analysis of integrated energy saving measures to help identify all technically feasible and cost effective energy savings, and then follows up by providing support for the implementation of those measures. For new buildings, FBC and FEI offered custom program pathways for support of both BC Energy Step Code-aligned buildings and non-aligned buildings.

FBC and FEI completed the pilot recommissioning offer, which identifies building operational improvements, in the FBC service territory with 13 participants. The BC Utilities also launched a province-wide recommissioning program – the Continuous Optimization Program – in October of 2020.

1 FBC and FEI also launched the Commercial Energy Assessment program in September 2020
2 that provided walkthrough and virtual energy assessments to small and medium businesses and
3 organizations.

4 **4.3 *PRESCRIPTIVE PROGRAM***

5 This program provides rebates for the installation of high efficiency electric equipment in various
6 applications including lighting, space heating, commercial kitchen, commercial laundry and
7 refrigeration equipment. Simple rebates are provided for equipment that meets specific
8 performance standards, as opposed to the Custom Program, which requires more detailed
9 analysis of measures as installed. The program makes use of midstream and downstream rebate
10 delivery approaches, as warranted by the specifics of each appliance type and the market it is
11 intended to serve.

12 New offers in 2020 included connected thermostats, heating, ventilation and air conditioning
13 controls, and rink de-aerators.

14 **4.4 *SELECTED HIGHLIGHTS***

15 The Commercial Program Area activity in 2020 resulted in 11.1 GWh/year of electricity savings.
16 These programs enabled commercial and institutional customers to conduct both simple and
17 comprehensive energy efficiency upgrades at their buildings.

18 FBC experienced higher than anticipated participation in its Custom Program offers for high
19 performance new construction, particularly in the multi-unit residential sector. However, FBC saw
20 limited activity in its Custom Program offers for retrofit due to a pause in infrastructure spending
21 for key municipal, education, and health customers.

22 FEI and FBC also launched a limited time bonus offer to both Prescriptive and Custom Programs
23 to encourage customers to invest in energy efficiency during 2020's challenging economic
24 climate. The limited-time bonus offers for both programs expire in 2021. The bonus offer has
25 yielded increased participation in the Prescriptive Program and has identified additional retrofit
26 opportunities in the Custom Program that are forecast to be implemented in 2021 and 2022.

5. INDUSTRIAL PROGRAM AREA

5.1 OVERVIEW

The Industrial DSM programs continued to encourage industrial customers to consume electricity more efficiently. The Industrial programs achieved an overall TRC of 3.7, with electricity savings of 6.8 GWh, more than double the 2019 savings of 3.0 GWh. Actual Industrial expenditures in 2020 totalled \$1.8 million, compared to \$1.1 million in 2019, of which 87 percent was incentives.

Table 5-1 summarizes the Plan and actual expenditures for the Industrial Program Area in 2020, including incentive and non-incentive spending, and annual electricity savings.

Table 5-1: 2020 Industrial Program Results Summary

Program	Savings (kWh)		Plan (\$000s)	Actual Expenditures (\$000s)		
	Plan	Actual	Total	Total	Incentive	Non-Incentive
Industrial Custom	8,226,000	4,490,967	1,308	1,092	1,083	9
Industrial Prescriptive	1,780,686	2,303,850	290	455	455	1
Labour and expenses	-	-	190	220	-	220
Total	10,006,686	6,794,817	1,788	1,767	1,537	230
Plan including 2019 Carryover (254)			2,042			

The Industrial Program Area is characterized by large intermittent projects that generally occur less frequently and take much longer to complete, so the realization of energy savings may shift to the following year(s). In 2019, much of the program activity concerned investigating and encouraging efficient electric usage in new cannabis production facilities, while supporting existing industrial customers. In 2020, FBC realized much of the savings associated with those 2019 activities.

5.2 CUSTOM PROGRAM

This program provides incentives to encourage participants in pursuing a performance based approach to achieving electricity savings in new and existing industrial facilities. The program encourages detailed analysis of integrated energy saving measures to help identify technically feasible and cost effective energy savings, and then follows up by providing support for the implementation of those measures.

In 2020, FBC also conducted a pilot to extend the FEI Strategic Energy Management cohort offer to one wood products customer in the FBC service territory. This pilot will be expanded into a full offer in 2021.

5.3 *PREScriptive PROGRAM*

This program provides rebates for the installation of high efficiency electric equipment in various applications including lighting, space heating, irrigation, variable speed drives and certain compressed air equipment. Simple rebates are provided for equipment that meets specific performance standards, as opposed to the Custom program, which requires more detailed analysis of measures as installed. The program makes use of midstream and downstream rebate delivery approaches, as warranted by the specifics of each appliance type and the market it is intended to serve.

5.4 *SELECTED HIGHLIGHTS*

Industrial Energy Efficiency Program Area activity in 2020 resulted in 6.8 GWh/year of electricity savings. These programs enabled industrial customers to conduct both simple and comprehensive energy efficiency upgrades at their buildings. FBC saw a significant increase in indoor agricultural LED lighting projects for both cannabis and traditional greenhouse applications. FBC will begin developing a prescriptive rebate for indoor agricultural LED lighting projects to launch later in 2021.

FEI and FBC also launched a limited time bonus offer to both Prescriptive and Custom Programs to encourage customers to invest in energy efficiency during 2020's challenging economic climate. The limited-time bonus offers for both programs expire in 2021. The bonus offer has yielded increased participation in the Prescriptive Program and has identified additional retrofit opportunities in the Custom Program that are forecast to be implemented in 2021 and 2022. However, as a consequence of the bonus offer, the ratio of expenditures to electricity savings was higher in 2020.

FBC also began providing enhanced compressed air system assessment services lending specialized testing equipment at no-cost to industrial customers.

6. CONSERVATION EDUCATION AND OUTREACH

6.1 OVERVIEW

The Conservation Education and Outreach (CEO) Program Area continues to support the DSM Portfolio goals of energy conservation in a variety of ways. In order to foster a culture of conservation, several initiatives and campaigns were undertaken in 2020, providing information about behaviour change and customer attitudes on efficiency. Educating all types of customers, and students (who are future customers), remains a strong priority. FBC is continuing to ensure steps are taken to make the information provided relevant and timely.

FBC continued its collaboration with FEI in 2020 to maximize efficiencies across both utilities. Costs continue to be shared on school, residential and commercial outreach as applicable.

Table 6-1: 2020 Conservation and Outreach Results Summary

Program	Plan (\$000s)	Actual (\$000s)
Residential Education Program	221	193
Residential Customer Engagement Tool	207	58
Commercial Education Program	22	212
School Education Program	48	102
Total	497	566

6.2 RESIDENTIAL EDUCATION

FBC continued with its “We’ve got rebates” general marketing campaign during the first quarter of the year. As a result of the COVID-19 pandemic FBC pivoted the “We’ve Got Rebates” campaign to focus less on equipment upgrades and more on energy saving behaviour advice as British Columbians were asked to stay at home to prevent the spread of COVID-19. The campaign focused on ways customers could reduce their energy bills with low cost or no cost tips. As restrictions throughout the province eased in the fall, FBC produced a campaign to promote the increased residential rebates that were available until the end of the year. FBC and FEI continued to enhance the municipal landing page to further support municipalities’ efforts to promote FBC and FEI rebates and behaviour change.

6.3 CUSTOMER ENGAGEMENT TOOL

The Residential Customer Engagement Tool expenditure was below Plan due to the launch being delayed to 2021 as a result of challenges with the vendor software integration and home energy report display quality issues. As a result, focus was placed on launching the online portal and home energy reports for natural gas (FEI) customers successfully before completing development for the electricity (FBC) version. With the FEI version now in market, attention has shifted to completing development for the FBC version by mid-2021.

6.4 COMMERCIAL EDUCATION

Expenditures were higher than planned to drive program participation and awareness of Commercial rebate programs. The expenditures for paid media to reach commercial customers were underestimated in the DSM Plan. This will require a higher investment through the remaining DSM Plan years to ensure the message remains consistent in market for commercial customers.

The seventh annual Efficiency in Action awards were held virtually and delivered jointly by both utilities. These awards recognize FBC and FEI commercial customers that have most effectively used C&EM programs and achieved natural gas and electricity energy savings.

CEO continued to provide information to customers and the public on electricity conservation and energy literacy. In collaboration with FEI, to continue to support and engage small to medium size businesses, FBC funded 593 energy assessments across the province. Customers received advice on saving energy and learned about rebates on high-efficiency upgrades. With the onset of COVID-19 in March 2020, FBC worked with its vendor to pivot the program to a virtual model to ensure continued support for small business customers. The virtual model expanded the reach to all FBC and FEI customers across the province. The virtual assessments focused on low cost, no cost measures to reduce business's energy consumption, as well as turn-down procedures for those who had closed their businesses due to the pandemic. Customers were referred to the program through the customer contact centre in addition to outbound calling by the vendor.

FBC's partnership with BC Hydro continued in 2020. This included collaboration on the Energy Wise Network Program for commercial customers which helps engage workplaces to save energy through training, networking, campaign toolkits, and energy coaching.

6.5 SCHOOL EDUCATION

Expenditures were higher than planned to reflect the extensive development work completed to support teachers, parents and students during the pandemic.

FBC's Energy Leaders initiative offers curriculum-connected lesson plans for grades K-12. To further support teachers and parents through the COVID-19 pandemic, 32 lesson plans were modified to incorporate distance learning to support home-based and virtual learning. Further development was also completed to translate 147 lessons on Energy Leaders from grades 1-10 into French, including the distance learning modules. Grade 11 and 12 lessons are currently being translated to French and/or modified for distance learning. Professional development webinars have been created to help teachers get acquainted with the Energy Leaders lesson materials and the way they connect to the current curriculum.

To further support teachers during the pandemic, the BC Lions Energy Champions program and FBC's Energy is Awesome program have moved to virtual models.

For students enrolled in post-secondary institutions, FBC continued to deliver in-class (pre-pandemic) and virtual presentations to post-secondary institutions. This presentation speaks to demand side management policies and programs in British Columbia, as well as employment opportunities within the energy management area.

6.6 HIGHLIGHTS

The Commercial, Residential and School Education Programs are not incentive-based programs and therefore FBC does not attribute direct savings to them. CEO costs are included at the Portfolio level and incorporated into the overall DSM Portfolio cost-effectiveness results.

The initiatives described in CEO are designed to foster a culture of energy conservation in BC through activities designed to deliver overall conservation messaging, support energy efficiency literacy, and assist with increasing program awareness. By changing attitudes and behaviours, the Company will help communities reach their goals, help customers save energy and money, and increase participation in DSM programs. In 2020, this Program Area continued to explore new ways and seek out new opportunities and channels to connect with customers to ultimately grow the culture of energy conservation.

7. SUPPORTING INITIATIVES

7.1 OVERVIEW

Supporting Initiatives support the goals of conservation and energy management in a variety of ways, from co-funding energy specialist positions, to promoting energy conservation at community events.

The majority of Supporting Initiative activities are comprised of non-incentive based programs (with the exception of the Commercial and Community Energy Specialist Programs), therefore FBC has not attributed any direct savings to them. Supporting Initiatives costs are included at the portfolio level and incorporated into the overall portfolio cost-effectiveness results. Non-Program Area specific costs, such as telephone and tracking system upgrades, are also reported herein.

Actual expenditures were 98 percent of Plan and are summarized below in Table 7-1.

Table 7-1: 2020 Supporting Initiatives Results Summary

Program	Savings (kWh)	Plan (\$000s)	Actual (\$000s)		
	Actual	Total	Actual (\$000s)	Incentive	Non-Incentive
Commercial Energy Specialist	209,000	61	85	85	-
Community Energy Specialist	-	204	108	108	-
Trade Ally Network	-	151	152	-	\$ 152
Codes and Standards	-	107	108	-	\$108
Reporting Tool & Customer Portal	-	14	229	-	\$ 229
Labour and Expenses	-	300	136	-	\$ 136
Total	209,000	838	818	\$ 193	\$ 625
Plan incl. 2019 Carryover (349)		1,187			

7.2 COMMERCIAL ENERGY SPECIALIST PROGRAM

The Commercial Energy Specialist Program is a joint initiative between FBC and FEI that co-funds Energy Specialist positions in large commercial organizations, including institutional and local government customers. FBC provides up to \$40 thousand per year in an annual contract, with a matching amount provided by FEI.

A Commercial Energy Specialist's key priority is to identify and implement opportunities for their organization to participate in FBC's and FEI's DSM programs, while also identifying and implementing non-program specific opportunities to use electricity and natural gas more efficiently. There were seven participants in the SST in 2020. Some organizations had new Energy Specialist positions start later in the year, hence a full year of funding was not distributed in those instances. FBC considers this an energy management program, and hence a specified demand-side measure, as defined in the DSM Regulation.

This program is funded as an enabling activity but claims kWh savings for projects completed by energy specialists that are not claimed by another FBC DSM program. The total verified annual savings for 2020 were 209,000 kWh.

7.3 COMMUNITY ENERGY SPECIALIST PROGRAM

This program funds Community Energy Specialist positions in local municipal governments and regional districts to facilitate energy efficiency planning activities. These include coordinating development of community energy plans; developing and promoting community-level energy related policy; marketing initiatives to promote conservation and efficiency at the community level; and energy efficient design practices and organizational policies such as adopting advanced energy efficiency standards for the entities' own buildings.

There were four participants in the SST in 2020. Some participants had their Community Energy Specialists in place for only part of the year, and some organizations delayed hiring to 2021 due to the COVID-19 pandemic; hence, the 2020 Plan expenditures were not fully realized.

7.4 TRADE ALLY NETWORK

The Trade Ally Network (TAN) is FBC's contractor network whose main objective is to advance energy efficiency messaging and to promote the Company's DSM programs. The TAN is comprised of contractors, equipment manufacturers, distributors and, as of 2020, commercial Point of Sale partners were also added. FBC recognizes the important role these industry groups play when it comes to influencing residential and commercial customers when making energy efficiency decisions.

TAN is an essential initiative under Enabling Activities that supports and supplements DSM program development and delivery, by providing FBC with a direct communication channel with the industry stakeholders. TAN also supports the interests of FBC by:

- providing trade allies with co-op funding for advertising delivering targeted messaging about energy efficiency, and to promote C&EM rebate programs;
- Funding eligible training that relates to the promotion and sales of high efficiency appliances, appliance safety, installation, best practices, or similar courses related to energy efficient measures that support FBC's current rebate programs.

To support the trade allies through the challenging times posed by the COVID-19 pandemic, FBC engaged with several reputable third-party organizations to develop and/or offer training opportunities for the TAN members to help them stay competitive in the changing marketplace, and enable them to continue selling energy efficient products despite the pandemic. The training focused on improving their knowledge of best practices around improving Indoor Air Quality (IAQ) and selling energy efficient products in an uncertain market; in addition, a self-guided course was developed to help trade allies familiarize themselves with protocols and provincial guidelines aimed at improving employee and customer safety amid the pandemic.

7.5 CODES AND STANDARDS

The FBC codes and standards budget funded a number of Canadian Standards Association (CSA) projects:

- Review and updates to a document for CSA EXP07:19: Load-based and climate-specific testing and rating procedures for heat pumps and air conditioners;
- FBC has signed a 3-year funding agreement with CSA to continue supporting relevant codes and standards work.

FBC was also part of several committees to guide and contribute to the development of codes and standards, including CSA Communities and CSA Technical Committee on Heating Ventilation Air Conditioning and Refrigeration. FBC plans to continue participating in these projects and committees in 2021.

7.6 REPORTING TOOL & CUSTOMER APPLICATION PORTAL

The reporting tool and customer application portal is a joint initiative between FBC and FEI. The tool launched seven residential programs in 2020 with the remaining residential and commercial programs set to launch in 2021.

The reporting tool offers customers an online portal to apply for their rebates as well as track its status. The tool also offers FBC and FEI a tracking software to process applications and provide in-depth reporting. The tool is fully integrated to other technologies such as Account Online and SAP accounting software.

As discussed in FBC's 2019 Annual Report, those integrations increased scope to the project and the schedule was delayed, which resulted in pushing a significant portion of 2019's budgeted costs into 2020.

8. PORTFOLIO EXPENDITURES

8.1 OVERVIEW

Portfolio expenditures consist largely of Planning & Evaluation (P&E) activities, include staffing costs and consultant fees for the various studies, plus Innovative Technology pilots undertaken. The actual Portfolio expenditures for 2020 were \$0.9 million, nearly 100 percent of Plan.

Table 8-1: 2020 Portfolio Expenditures Results Summary

Program	Plan (\$000s)	Actual (\$000s)
Monitoring and Evaluation	118	209
DSM Studies	133	101
Innovative Technologies	102	166
Labour and Expenses	560	435
Total	913	911
Plan including 2019 carryover (14)	927	

Portfolio expenses also include any costs incurred to engage the Energy Efficiency and Conservation Advisory Group (EECAG). EECAG members provide insight and feedback on FBC's Portfolio of DSM activities and related issues. This includes DSM program and Portfolio performance, development and design, funding transfers (exceeding the 25 percent threshold), policy and regulations that may impact DSM activities, and other issues and activities as they arise. The EECAG met twice in the fall, using remote technology, to discuss 2020 YE forecast results and other business.

8.2 PROGRAM EVALUATION ACTIVITIES

Primary types of Evaluation, Measurement and Verification (EM&V) activities include the following:

- Process evaluations, where surveys and interviews of participants and trade allies are used to assess customer satisfaction and program success;
- Impact evaluations, to measure the achieved energy savings attributable from the program, including free-ridership and spill-over⁴ impacts; and
- Measurement & Verification (M&V) activities, to confirm project specific energy savings associated with measures undertaken by customers.

⁴ Free-ridership refers to participants who would have participated in the absence of the program and spillover refers to additional reductions in energy consumption or demand that are due to program influence.
Reference: National Renewable Energy Laboratory, <https://www.nrel.gov/docs/fy17osti/68578.pdf>

Table 8-2 provides a list of the 2020 DSM Program evaluation and research activities undertaken by FBC in collaboration with utility partners as shown, chiefly FEI and BC Hydro.

Table 8-2: 2020 DSM Program Evaluation and Research Activities

Evaluation Name	Program Area	Type of Evaluation	Evaluation Partners	Evaluation Status
Commercial End Use Study	Enabling Activities	Customer Research	FEI	Survey conducted with commercial customers including multi-family residential buildings to collect information about the building, the business(es) occupying the building, the fuel choice for heating, cooling and cooking, the types and ages of the appliances installed, energy-use behaviors, and customer attitudes towards energy issues. Completed December 2020 by Sampson Research.
Energy Audit 2020 Update	Enabling Activities	Process/Impact	FEI	The study is an update to an energy savings audit to verify energy savings from projects completed in 2020. To be completed Q2 2021.
Retail Program Evaluation	Residential	Process & Impact	FEI	Customer survey, literature review and consumption analysis for the residential retail programs. To be completed Q2 2021.
Heat Pump Program	Residential	Process & Impact	None	Customer survey, trade ally and staff interviews and engineering analysis for the residential heat pump offers. To be completed Q1 2021.
Participant and Building Owner Surveys	Residential / Commercial	Process	FEI	Surveys conducted with building owner and tenant to assess customer satisfaction, program awareness, and gather feedback for future program design. 2019 results: Completed February 2020 by Cohesium Research. 2020 results: To be completed Q2 2021.
Direct Install Quality Assurance	Low Income	Evaluation Study	FEI & BCH	Ongoing quality assurance to ensure direct install measures are installed according to program policies and procedures.
Ongoing Customer Feedback Survey	Low Income	Process	FEI & BCH	Ongoing survey with Direct Install program participants to gather feedback on their customer experience, satisfaction with the program and the program representatives. Completed March 2020 by Sentsis Market Research.
Partnership Program Evaluation Study	Portfolio	Evaluation Study	FEI	Research study to gather feedback from industry experts, document review of guidelines and best practices for Partnership programs. To be completed Q2 2021.

8.3 EVALUATION REPORTS

Two evaluation reports were substantially completed in 2020: the Retail Program (consisting of Residential Lighting and Appliance programs); and the Heat Pump programs. The Retail Program report was scheduled for 2019, however, the planned in-store customer intercepts were delayed in 2019 and subsequently cancelled in 2020 due to the COVID-19 pandemic. Ultimately, a literature review of comparable evaluation studies was completed in place of the in-store intercepts to finalize the report.

The executive summaries of the evaluations of the Retail Program and the Heat Pump programs are included in Appendix B. The full reports are confidentially provided to the BCUC in a separate appendix, Appendix C.

FBC requests that the Evaluation Reports be filed on a confidential basis pursuant to Section 18 of the BCUC's Rules of Practice regarding confidential documents adopted by Order G-15-19. The Evaluation Reports must be kept confidential on the basis that these reports contain customer-specific information that should not be disclosed to the public. In addition, the methodology and processes used in the reports are proprietary to the consultants hired by FBC.

High level findings of the Retail Program evaluation are:

- For Lighting/POS, the final net realization rate⁵ is 66 percent of the original *ex ante*⁶ kWh savings numbers, and 79 percent for kW savings. For Appliances, the final net realization rate is higher at 93 percent combined for all three appliances (washers, dryers and refrigerators).
- The spillover rate for the lighting program decreased considerably from the prior evaluation, from 0.77 to 0.15.

High level findings of the Heat Pump Program evaluation are:

- The program has a final net realization rate of 102 percent of the original *ex ante* kWh savings and 56 percent of kW savings.
- The free ridership and spillover rates for central and ductless heat pumps remained fairly consistent with the prior heat pump evaluation.

8.4 DSM STUDIES

DSM studies undertake key research, e.g. end-use surveys, and support long-term planning such as Conservation Potential Reviews. The Company's 2020 DSM Studies included:

- Disaggregation report to determine which end-use loads, and the magnitude thereof, could be detected from AML data;
- 2020 Conservation Potential Review (CPR), to update the achievable potential available for FBC's DSM programs. The 2020 CPR update will be completed and filed with FBC's 2021 Long Term Electric Resource Plan (LTERP).

8.5 INNOVATIVE TECHNOLOGIES

Innovative technology funding supports the development, or increased use, of a "technology, a system of technologies, or a building or industrial facility design that could achieve significant reductions of energy usage or significantly more efficient use of energy"⁷. FBC uses innovative technology funding to support feasibility studies, technology pilots, and field studies to assess the potential for these technologies.

In 2020, FBC funded a number of innovative technology studies. A field study to assess the performance of cold climate heat pumps was completed, in partnership with Natural Resources Canada, BC Hydro, and EMLI. This study will be used to help increase adoption of heat pumps and improve energy savings assumptions for the technology.

⁵ The net realization rate is the gross realization rate multiplied by the final Net-to-Gross ratio.

⁶ *Ex ante* refers to the estimates the Company used to prior to the evaluation.

⁷ Technology innovation program defined in the Demand-Side Measures Regulation 326/2008 (amended Mar. 24, 2017).

Key results of the BC Cold Climate Heat Pump Field Study showed that:

- The average coefficient of performance (COP) was greater than 2.3 for ductless mini split units and 3.2 for central units. The COP declined with colder temperatures, however remained greater than 1 on average at temperatures down to -14°C.
- For participants who switched to a heat pump from an electric heating system (baseboards/electric furnace), average savings were found to be 5,650 kWh and \$810 over the year-long monitoring period.
- There is potential for widespread adoption of heat pumps in British Columbia within Climate Zones 4 and 5, which cover the southern part of the province.

Additionally, a pre-feasibility study was conducted that looked at a number of emerging technologies in the commercial/industrial sector including commercial drain water heat recovery, switched reluctance motors, and EndoCube refrigeration system controls. The results from this study will help inform whether to pilot these technologies or determine if the equipment is established enough to include in our prescriptive rebate programs.

9. DEMAND RESPONSE

9.1 OVERVIEW

The initial pilot phase of Demand Response (DR), testing the viability of voluntary demand response from a subset of FBC's top 50 large customers, was completed in 2020.

Table 9-1: 2020 Demand Response Results Summary

Program	Plan (\$000s)	Actual Expenditures (\$000s)		
		Total	Incentive	Non-Incentive
Demand Response	324	135	\$ 55	\$ 79
Plan including 2019 carryover (213)	538			

The 2020 expenditures totaling \$135 thousand, including \$55 thousand of customer incentives, were considerably less than the \$324 thousand Plan estimate developed in conjunction with the Kelowna Demand Response Assessment Report⁸. The procurement process yielded a more cost-effective proposal, hence, the 2020 Plan expenditures were not fully spent.

9.2 KELOWNA AREA DEMAND RESPONSE PILOT – KEY FINDINGS

The DR pilot, was launched in August 2019 and initially reported on last year. Extending the DR pilot for the full additional 2020 summer season saw a significant increase in Demand Response delivered, participation, and learnings for the pilot.

Expanding the pilot to include two industrial participants from the West Kootenay area, as well as increasing the incentive amount, attracted more participation and a more diverse set of participants. Participants found the voluntary (Manual DR) system attractive as it provided operational flexibility. Auto-DR is typically more common in mature markets, and would require more education, experience and additional lead time for installation.

Participant enrollment, response to dispatch, as well as performance all improved significantly in the winter and second summer seasons. A total of 12 sites were enrolled by the end of the DR Pilot, and made up an engaged customer base. The highest results were seen during both the coldest days in winter and the hottest days in summer, suggesting that DR can be a reliable resource.

The DR pilot generated peak reductions of 1.33 MW and 0.7 MW, in the summer 2020 and winter 2019-2020 seasons, respectively. All surveyed customers were satisfied with their experience and communicated interest in future participation.

⁸ Appendix A-1 of FBC's approved 2019-2022 DSM Expenditure Plan

10. 2020 DSM PROGRAMS ANNUAL REPORT SUMMARY

In 2020, FBC achieved 96 percent of its total approved DSM expenditures and 81 percent of its annual energy savings target for the year, based on the 2019-2022 DSM Plan. Customer incentives were the largest cost component, making up 59 percent of the overall portfolio expenditures. The total energy savings of 26.2 GWh include Residential at 7.2 GWh or 128% of Plan, and Industrial at 6.8 GWh that was more than double the 2019 result of 3.0 GWh, despite a shortfall of cannabis production facilities compared to Plan.

The Report detailed how FBC cost-effectively delivered these programs achieving an overall Benefit/Cost ratio of 1.6 as the portfolio level TRC. After intra-program transfers, all of which complied with the maximum 25% transfer limit, FBC was left with a \$409 thousand residual amount that will be carried forward to be utilized within the 2019-2022 DSM Plan period.

FBC was able to increment its incentive expenditures and associated energy savings while putting in place strong COVID-19 safety protocols in accordance with Provincial Health directives. The Company continues to offer a robust portfolio of DSM programming accessible to all customer rate classes, whilst meeting the adequacy requirements of the DSM Regulation and operating according to the Company's DSM Guiding Principles.

* In the 2019-2022 DSM Expenditures Plan, several existing DSM programs were reorganized and/or consolidated into new programs:

Residential: The Residential Home Improvements program name changed to the Home Renovation Rebate (HRR) program. Heat pumps, water heaters and appliances were consolidated into the HRR program. Behavioral was moved into Conservation Education & Outreach (CEO) which is now a program area.

Low Income: The Low Income was placed into its own program area, and was separated into Self-Install, Direct Install and Social Housing Support.

Commercial: The Commercial Custom and Prescriptive programs both include lighting. MURB New Construction was moved into the Custom program and Building and Process Improvements was moved into the Prescriptive program.

Industrial: The Industrial Efficiency program was separated into both the Industrial Custom and Prescriptive programs.

Portfolio Expenditures: Planning & Evaluation was moved into the Portfolio Expenditures portfolio.

Labour & Expenses: Starting in 2018 these costs are broken out (shown) by program area. In prior years such costs were embedded into individual programs.

Appendix B

PROGRAM EVALUATION EXECUTIVE SUMMARIES

Evaluation of the FortisBC Residential Retail (Lighting and Appliance) Programs

March 19, 2021

Dr. Phil Willems / PWP

Executive Summary

This report presents the independent evaluation results for the FortisBC Residential Lighting and Appliances program. The evaluation covered eligible measures that received rebates through the program between 2017 and mid-2019 and was conducted by the Evergreen Economics team that consists of the following firms:

- Evergreen Economics (prime contractor)
- EcoMetric
- Phil Willems/PWP
- Discovery Research

As part of this effort, both programs were evaluated:

- **Lighting.** The FortisBC Residential Lighting Program is a two-part campaign that provides point-of-sale (POS) rebates for energy efficient lightbulbs, as well as other non-lighting measures such as bathroom fans and smart thermostats made in the spring and fall at qualifying stores.
- **Appliances.** The FortisBC Residential Appliance Program provides rebates for the purchase of larger energy efficient measures such as clothes washers, clothes dryers, and refrigerators.

Evaluation Methods

The evaluation relied on three primary analysis methods to derive gross and net impacts for the program:

- **Engineering analysis.** All of the deemed savings values were subjected to an engineering review as part of the impact evaluation. This review involved assessing the values for reasonableness, examining key calculation components such as operating hours, and comparing the parameters with values found in other reference sources. Based on the review of the available information (and the spreadsheet tools used by the program to calculate savings), an engineering adjustment factor was calculated from the sample and then applied to the participant population.
- **Self-report free-ridership analysis.** Appliance program participants were targeted with a phone survey (n=196) that collected information on what equipment might have been installed (if any) had the product rebates not been provided by FortisBC. Responses for these questions were scored and used to create an estimate of program free ridership and spillover.
- **Literature review.** For the POS rebates for lighting and other measures, a literature review was conducted of comparable evaluation studies covering these measures to determine recommended values for these programs. Originally the evaluation team planned to conduct intercept surveys of customers at participating retailers. However, the team was denied access to the stores for the surveys and the literature review was completed as the next best alternative.

Impact Evaluation Results

The following tables summarize the impact analysis results. Table 1 shows the engineering adjustments for the Lighting/POS measures (both kWh and kW) and for the appliance measures (kWh only). The adjustments were due to changing the savings calculation input parameters such as hours of use based on different secondary sources that the evaluation team believed were more current and/or applicable to the FortisBC territory.

Table 1: Engineering Adjustments

Measure	Gross Realization Rate (kWh)	Gross Realization Rate (kW)
Lighting	99.7%	121.9%
Other POS	137.7%	98.7%
Clothes Washers	194.7%	--
Clothes Dryers	71.4%	--
Refrigerators	104.6%	--

Table 2 shows the results of the net impact analysis for both programs. For Lighting and the other POS measures (ceiling fans, smart thermostats), free ridership and spillover results were derived from the literature review of comparable residential lighting program evaluations. For the appliance measures, the free ridership and spillover numbers were calculated from the participant survey questions as part of the current evaluation.

Table 2: Net-to-Gross Results (Lighting/POS and Appliances)

Measure	Free Ridership	Spillover	Final Net-to-Gross Ratio*
Lighting	0.50	0.15	0.65
Ceiling Fans	0.38	0.04	0.66
Smart Thermostats	0.30	0.05	0.75
Clothes Washers	0.35	0.17	0.82
Clothes Dryers	0.38	0.15	0.77
Refrigerators	0.42	0.19	0.77

*Net-to-Gross is calculated as 1 - Free Ridership + Participant Spillover

Table 3 and Table 4 show the combined gross and net impact results for both programs. For Lighting/POS, the final net realization rate is 66 percent of the original *ex ante* kWh savings numbers, and 79 percent for kW savings. For Appliances, the final net realization rate is higher at 93 percent combined for all four appliances.

Table 3: Lighting/POS Impact Results

Unit	<i>Ex Ante</i> Savings	Gross Realization Rate (%)	Gross Annual Savings	Net-to-Gross Ratio	Net Annual Savings	Final Net Realization Rate
kWh	8,848,175	101.3%	8,962,421	0.65	5,825,574	66%
kW	6,421.94	121.8%	7,821.18	0.65	5,084	79%

Table 4: Residential Appliances Combined Results (kWh)

Unit	<i>Ex Ante</i> Savings	Gross Realization Rate (%)	Gross Annual Savings	Net-to-Gross Ratio	Net Annual Savings	Final Net Realization Rate
kWh	1,286,903	118.0%	1,518,744	0.79	1,199,808	0.93

Process Evaluation

The process evaluation consisted primarily of phone surveys of customers that participated in the Appliances program. Among 196 phone survey participants, 50 percent purchased reported receiving a rebate for an ENERGY STAR refrigerator, 42 percent purchased an ENERGY STAR clothes washer, and 41 percent received a rebate for an ENERGY STAR clothes dryer.

Nearly all of the appliances were installed in the participants' homes, with between 92 percent and 95 percent of those installations replacing an existing appliance—most of which were picked up by the installer, recycled, or sold / given away.

The vast majority of participants learned about FortisBC's Residential Appliance Program either from sales personnel at the store of purchase or by FortisBC advertising. Additionally, 81 percent of participants felt the rebate information was very clear, with less than 3 percent indicating the information was not at all clear.

Respondents were asked whether energy efficiency was a priority when deciding on the appliance(s) they ultimately chose. More than half of respondents (63 percent) rated energy efficiency as a "high priority" when making decisions on the appliance(s) they chose, with only a small portion (3 percent) of respondents reporting it was either a "small priority" or "not at all a priority".

Overall, a significant percentage of survey participants were very satisfied with the program overall (92 percent), the equipment they purchased through the program (91 percent), the overall rebate provided through the program (85 percent) and the time it took to receive the rebate (84 percent). Although respondents reported high levels of satisfaction with all of the program components, the time it took to receive the rebate received the lowest satisfaction rating, with seven percent of respondents reporting they were not satisfied. Some of the justification's participants provided for their low satisfaction ratings were that the rebate process was confusing, the program should include smaller household appliances, and the rebate should be given at the time of purchase.

Conclusions and Recommendations

General evaluation conclusions include the following:

Participants are generally very satisfied with the program. Survey responses indicate a high level of satisfaction, with over 90 percent of respondents being satisfied with the program overall.

Customers are concerned about energy efficiency but are only somewhat knowledgeable about ways to save energy. Participant surveys indicate that customers make energy efficiency a priority when deciding on equipment installations or retrofits. However, most (69 percent) are only somewhat knowledgeable about ways they can save energy in their homes. Evergreen recommends providing ongoing and additional resources to help promote ways to save energy in homes.

Net impacts consistent with similar programs. The net-to-gross ratios estimated for the appliance program are consistent with expectations and the Evergreen team's experience with similar programs. For the point-of-sale program, net-to-gross ratios used were based on a literature review of similar programs, since it was not possible to conduct an intercept survey to gather primary data.

Better tracking of specific lighting measures would improve the evaluation. The Evergreen team was not able to match the savings for 1,478 projects (44%) listed in the program tracking data to the savings calculated in the supplied deemed savings document. The savings in the deemed savings document are linked to the projects listed in the program tracking data using the Retailer SKU. The Evergreen team recommends FortisBC develop deemed savings for each Retailer SKU.

Review how deemed savings are tracked in the program tracking data. The energy and demand savings listed in the program tracking data did not match the deemed saving values for many of the Lighting and Appliance measures. Evergreen recommends FortisBC review the program tracking data to ensure there is agreement between the calculated deemed savings values and the values listed in the program tracking databases.

Routinely update list of energy efficient clothes dryers, clothes washers, and refrigerators using available data from the Consortium of Energy Efficiency (CEE). CEE actively maintains a list of equipment make/model numbers, size, and CEE efficiency Tier. Evergreen recommends FortisBC routinely update their internal list of make/model numbers and CEE tiers to ensure the consistent application of energy savings.

Track additional variables to more accurately calculate savings for clothes washers. The CEE savings matrix includes three variations of fuel types for domestic hot water (DHW) and dryer configurations – Electric DHW/Electric Dryer, Gas DHW/Electric Dryer, Gas DHW/Gas Dryer. Evergreen recommends FortisBC track fuel type for both the DHW and dryer in the program tracking data.

Prior to a store visit, knowledge of rebates was low. In general, most respondents were not aware of the rebate offerings before entering the store, with 67 percent learning about the rebate from the store sales personnel. Evergreen recommends increasing marketing efforts outside of store sales personnel.

Evaluation of the FortisBC Residential Heat Pump Offer

Draft Report

March 19, 2021

Submitted by Evergreen Economics

1 Executive Summary

This report presents the independent evaluation results for the FortisBC Residential Heat Pump program. The evaluation covered eligible measures that received rebates through the program between 2017 and mid-2020 and was conducted by the Evergreen Economics team that consists of the following firms:

- Evergreen Economics (prime contractor)
- Michaels Energy
- Phil Willems/PWP
- Discovery Research

1.1 Evaluation Methods

The evaluation relied on two primary analysis methods to derive gross and net impacts for the program:

- **Engineering analysis.** All of the deemed savings values were subjected to an engineering review as part of the impact evaluation. This review involved assessing the values for reasonableness, examining key calculation components such as operating hours, and comparing the parameters with values found in other reference sources.
- **Self-report free ridership analysis.** Heat pump program participants were targeted with a phone survey that collected information on what equipment might be installed (if any) had the product rebates not been provided by FortisBC. Responses for these questions were scored and used to create an estimate of program free ridership and spillover.

1.2 Impact Evaluation Results

The following tables summarize the impact analysis results. **Error! Reference source not found.** shows the engineering adjustments for the heat pump measures (both kWh and kW).

Table 1: Engineering Adjustments

Measure	Gross Realization Rate (kWh)	Gross Realization Rate (kW)
All heat pumps	1.42	0.87
Heat pump water heaters	1.31	0.34
Heat pump tune-ups	1.00	1.00

Error! Reference source not found. shows the results of the net impacts analysis for the program. The free ridership and participant spillover numbers were calculated from the participant survey questions as part of the current evaluation.

Table 2: Net-to-Gross Results

Measure	Free Ridership	Participant Spillover	Final Net-to-Gross Ratio*
Central heat pumps	0.34	0.06	0.72
Ductless heat pumps	0.38	0.03	0.65
All heat pumps	0.36	0.04	0.68
Heat pump water heaters	0.13	0.55	1.42
Heat pump tune-ups	0.57	0.58	1.01

*Net-to-Gross is calculated as 1 - Free Ridership + Participant Spillover.

** Evergreen calculated a free ridership rate for loan survey participants of 0.25.

Error! Reference source not found. shows the combined gross and net impact results for the program. The program has a final net realization rate of 102 percent of the original *ex ante* kWh savings and 56 percent of kW savings.

Table 3: Heat Pump Program Impact Results Summary

Unit	<i>Ex Ante</i> Savings	Gross Realization Rate	Gross Annual Savings	Net-to-Gross Ratio	Net Annual Savings	Final Realization Rate
kWh	3,990,721	1.38	5,520,723	0.74	4,085,335	102%
kW	1,636	0.79	1,299	0.71	923	56%

1.3 Process Evaluation Results

The process evaluation consisted primarily of phone surveys of customers who participated in the Residential Heat Pump program. Among 285 phone survey participants, 36 percent reported receiving a rebate for a heat pump tune-up, 34 percent purchased a ductless air source heat pump, 18 percent purchased a central air source heat pump, and 12 percent purchased a heat pump water heater.

Participants initially learned about FortisBC's Residential Heat Pump program either from the contractor or vendor who installed the equipment or from FortisBC advertising. Additionally, 78

percent of participants felt the rebate information was clear, with 3 percent indicating the information was not clear.

Respondents were asked whether energy efficiency was a priority when deciding on the energy efficiency upgrade they ultimately chose. The majority of respondents (82%) rated energy efficiency as a “high priority” when making decisions on equipment installations and retrofits, with a small portion (<1%) of respondents reporting it was a “small priority.”

Overall, surveyed participants expressed high levels of satisfaction with the Residential Heat Pump program. The majority of respondents reported high levels of satisfaction with all of the program components, which was consistent across all rebated program measures. Ninety-two percent of respondents were satisfied with the contractor who installed the equipment, followed by 89 percent being satisfied with the equipment rebated through the program, and 88 percent were satisfied with the program overall. Although respondents reported high levels of satisfaction with all of the program components, the rebate amount received the lowest satisfaction rating (but respondents were still satisfied), with 5 percent of respondents reporting they were not satisfied.

1.4 Conclusions and Recommendations

General conclusions and recommendations include the following:

Raise the heat pump loan limit to cover the full cost of an installed high efficiency heat pump. In today’s market, even ductless heat pump systems often cost more than the current \$6,500 cap on loans provided by the program, and most customers interested in using the loan program would have trouble coming up with the difference between the loan amount and the system cost, so contractors believe the loan limit should be raised. If desired, the loan limit could be raised to a higher amount specifically for central systems and multi-splits, both of which had average project costs in excess of \$10,000 in the program database. Contractors also emphasize that loan program participants almost certainly would not be able to participate in the program without that support, making them true net participants in the program rather than potential free riders.

Let customers and contractors know that FortisBC will continue to support printed applications. A concern noted by numerous contractors is that older, less affluent customers often lack access to or proficiency in online tools, thereby making it difficult for them to use the online application. Many struggle with the application and even ask contractors to complete the form on their behalf, which both places a burden on the contractor and requires the customer to release account information and other personal data to the contractor to apply on the customer’s behalf. Staff confirm that FortisBC is willing to assist with the application, but program outreach to both customers and contractors should emphasize that computer access is not required to participate in the program. Moreover, customer service representatives for the 800 numbers should be fully trained in the complex questions that may arise during the application process or should have access to someone within FortisBC who can handle such issues.

Offer rebates for replacing existing heat pumps. As the population of installed heat pumps begins to include even more units that are at least 10 years old, failures of those systems will become increasingly common, creating a potential opportunity for the heat pump program to influence the replacement decision. While savings from replacing an existing heat pump with a new premium efficiency model clearly cannot match those from replacing resistance heating systems, failure to recognize and incent the potential savings from a high efficiency new heat pump creates a lost opportunity for savings over at least the next decade. We recommend that FortisBC establish standards for determining savings in these situations, including perhaps a minimum age for the replaced equipment, as well as somewhat lower rebates and claimed savings.

Clarify Trade Ally Networks and certifications. There appears to be significant confusion among heat pump and heat pump water heater contractors regarding what it means to be a program trade ally. This is in part because of the long-standing existence of separate Trade Ally Networks (TANs) for contractors serving customers of the separate gas and electric utilities, as well as the emergence of a separate Program Registered Contractor (PRC) network for the CleanBC program, which is available to all customers in the province. We could not find a clear description of the various contractor networks and their associated requirements through the FortisBC website, which would help explain the confusion expressed by contractors—and presumably by customers seeking affirmation that they were choosing a reputable screened contractor. We strongly recommend that FortisBC provide a concise and easy to understand description of the various contractor networks, both in printed form and on the company website. This is especially important since FortisBC is moving in the direction of requiring all program-qualifying equipment to be installed by a certified contractor to be eligible for a rebate.

Improve program-specific training for Customer Service Representatives. Several interview respondents reported instances where customers, and even they as contractors, had received inaccurate information regarding program requirements and eligible measures. While it is understandable that the transition to an in-house call center would make it difficult for Customer Service Representatives (CSRs) who have to deal with questions regarding everything from bill issues and power outages to energy efficiency programs, it is important that customers and contractors get the accurate, up-to-date information they need. It may be possible to create a subgroup of CSRs with extra training in the efficiency programs to whom customers could be referred by other CSRs accustomed to handling more routine questions.

Expand outreach to less active contractors. While contractors who are very active in the program generally feel well informed about program updates, the one we spoke with who is less active said they find it difficult to keep up with program changes; for example, they were unaware of the double rebate offer until it had passed. Another, more active contractor said they had received no advance notice that this change was coming. A more systematic outreach effort to contractors who have done only a few projects through the program could serve to make them more aware of the benefits of the heat pump program generally and of trade ally status in particular. In addition,

as part of these outreach efforts, consider more advance notice to all participating contractors regarding upcoming promotions and changes in program requirements as the market evolves.

Ensure website and application data are consistent and up to date. Several contractors said they had encountered discrepancies between information posted on the FortisBC website and requirements included on the application form, and others said they were offering high efficiency equipment not shown on either the website or the application form. While it would obviously be challenging to update both the website and application in real time as new models come onto the market, the twice-yearly program updates agreed upon by the utilities and CleanBC may not be sufficient to keep up with changes in the market. We recommend the FortisBC consider a process whereby customers can be approved for newly available models that meet program criteria but are not shown on the most recent list of qualifying equipment.

Review the savings values for heat pump tune-ups. Because savings values for tune-ups were originally derived from a 2005 study that was conducted exclusively on central air source heat pumps, we recommend that FortisBC review the tune-up savings to determine a) whether the savings values should be adjusted for ductless systems and b) whether the savings should be adjusted based on the number of years since installation or since the most recent tune-up, which could affect the potential savings from proper maintenance.
